Environmental Interest/Information System
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Environmental Interest/Information System

NCDB (National Compliance Data Base) supports implementation of the Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA) and the Toxic Substances Control Act (TSCA). The system tracks inspections in regions and states with cooperative agreements, enforcement actions, and settlements.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Environmental Interest/Information System
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

FIS (New York - Facility Information System) is New York's Department of Environmental Conservation (DEC) information system for tracking environmental facility information found across the State.

 DEC Memo: 7/20/2015 - 1,000 gallon single wall steel heating oil tank removed from former industrial site by LaValley Bros. Tank exhibited several holes on bottom, and contaminated soil and fill (bricks, blocks, soil, etc.) noted at base of excavation. Walls of excavation appear to be clean and not exhibit any signs of contamination. LaValley excavated base of excavation to extent of excavator's reach then obtained composite floor sample to be analyzed for 8260, 8270 CP-51 compounds. Second sample obtained as composite of walls of excavation. Excavation site is at edge of future parking lot with no structures nearby. Area is served by municipal water and sewer. Virgin spill letter provided to LaValley to facilitate disposal of approx. 12-15 CY of contaminated soil. LaValley to provide closure report upon receipt of analytical data. KCKemp 4/8/2016 - Tracking down closure report. KCKemp
 Remarks: "excavating heating oil ust, contamination encountered."

Environmental Interest/Information System

US EPA TRIS (Toxic Release Inventory System) contains information from facilities on the amounts of over 300 listed toxic chemicals that these facilities release directly to air, water, land, or that are transported off-site.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

ICIS (Integrated Compliance Information System) is the Integrated Compliance Information System and provides a database that, when complete, will contain integrated Enforcement and Compliance information across most of EPA's programs. The vision for ICIS is to replace EPA's independent databases that contain Enforcement data with a single repository for that information. Currently, ICIS contains all Federal Administrative and Judicial enforcement actions. This information is maintained in ICIS by EPA in the Regional offices and at Headquarters. A future release of ICIS will replace the Permit Compliance System (PCS) which supports the NPDES and will integrate that information with Federal actions already in the system. ICIS also has the capability to track other activities occurring in the Region that support Compliance and Enforcement programs. These include; Incident Tracking, Compliance Assistance, and Compliance Monitoring.

Owner/Op end date: Not reported
 Handler Activities Summary:
 U.S. importer of hazardous waste: No
 Mixed waste (haz. and radioactive): No
 Recycler of hazardous waste: No
 Transporter of hazardous waste: No
 Treater, storer or disposer of HW: No
 Underground injection activity: No
 On-site burner exemption: No
 Furnace exemption: No
 Used oil fuel burner: No
 Used oil processor: No
 Used oil refiner: No
 Used oil fuel marketer to burner: No
 Used oil Specification marketer: No
 Used oil transfer facility: No
 Used oil transporter: No

 Update By: HDWARNER
 Site Description: Location: The site is located at 128 Spencer Street which is bounded by Court, Solar, and Spencer Streets in the City of Syracuse, Onondaga County. The site is approximately 8.13 acres in size. Site Features: On the southern and eastern portions of the site is an "L" shaped two-story building constructed of steel, concrete and masonry. The area to the west and north of the building is a paved parking lot. Current Zoning/Use: The site is currently vacant but was used for industrial activities. Historical Use: The site has been used for industrial activities. In the early 1900s the site was used for evaporating sheds as part of the local solar salt business. Around 1930's to 1950's there was construction of a manufacturing plant. Operations at the plant included electroplating, solvent degreasing, heat treating, painting and machining. The original plant was demolished in the 1950's when the current structure was erected. From approximately 1930 until 1997 the site was used for industrial manufacturing activities. The parcel is currently vacant. Site Geology and Hydrogeology: Information submitted with the BCP application regarding the environmental condition at the site are currently under review and will be revised as additional information becomes available.
 Env Problem: Information submitted with the BCP application regarding the conditions at the site are currently under review and will be revised as additional information becomes available.
 Health Problem: Information submitted with the BCP application regarding the conditions at the site are currently under review and will be revised as additional information becomes available.

Environmental Interest/Information System

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Environmental Interest/Information System
 RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Environmental Interest/Information System

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

 Date Record Added: 01/09/2007
 Date Rec Updated: 01/12/2016
 Updated By: SLEDWARD
 Site Description: This site transitioned into the Brownfield Cleanup Program from the Voluntary Cleanup Program (formerly Site # V00588). The site is located in a mixed residential, commercial and industrial land use area. Commercial properties are located to the south. It is bordered on the east, west and north by North Clinton Street, Franklin Street and Genant Street, respectively. The site is about two acres in size. The site building is primarily slab-on-grade construction except the three-story portion which has a basement one level deep. The building is open timber frame with a brick facade. It has been used in the past for various small manufacturing processes. The remaining land is paved except for a small strip along Franklin Street and the northeast corner which are weed covered. Several underground storage tanks (USTs) were present including two fuel oil USTs, one gasoline UST which likely contained leaded gasoline and a waste oil UST. Probable causes of contamination are storage and handling of fuels and solvents associated with a metal foundry, plastics injecting molding and metal stamping operations. The soil and groundwater has been contaminated by VOCs, SVOCs and heavy metals, most notably lead. A Remedial Investigation has been completed and a Remedial Action has been implemented. Various areas of contaminated soil have been removed, including the gasoline and waste oil USTs. The two fuel oil USTs were cleaned and closed in place. A sub-slab depressurization system has been installed beneath the building. A Final Engineering Report and OM&M Plan were received on 12/12/06. An Environmental Easement was filed on 12/6/06, and a Certificate of Completion was issued on 12/29/06. The project is currently in the site management phase, which includes maintenance of the cap and sub-slab depressurization system.
 Env Problem: A Remedial Investigation has been performed. Identified contaminants of concern include lead, VOCs and PAHs. Contaminated media include soil and groundwater. The selected remedial action included the removal of a limited amount of contaminated soil, installation of a sub-slab depressurization system beneath the building and

432 NORTH FRANKLIN STREET (Continued)

S108410663

Installation of an impervious clay cap over the remaining areas of concern. Remediation was performed per an approved Remedial Work Plan. An Environmental Easement restricts contact with soils and use of groundwater. The site does not pose a significant threat to the environment.
 Health Problem: Prior investigations identified soil and groundwater contaminated with volatile organic compounds, semivolatile organic compounds, and lead. Remediation of the site included excavation and removal of lead-contaminated soil and two underground storage tanks and associated impacted soils. The on-site building, pavement, and placement of an impervious clay cap in select areas will minimize the potential for human exposure to residual soil contaminants. An environmental easement in place imposes several institutional and engineering controls, including restricting site use to commercial and/or industrial purposes and prohibiting the use of groundwater as a source of potable or process water. A sub-slab depressurization system was installed beneath the on-site building to minimize human exposures through soil vapor intrusion. Exposures to contaminants in groundwater are not expected since the area is served by a municipal water supply. A soils management plan will be utilized when completing any future ground intrusive work (i.e., utility and/or soil excavation).

 Date Rec Updated: 02/08/2011
 Updated By: SRHEIGEL
 Site Description: Location: The American Bag and Metal Company Inc. site is located on Spencer Street in the City of Syracuse, Onondaga County, New York. Kirkpatrick Street is to the north of the site. Spencer Street is to the south, the City of Syracuse property is to the west, and an industrial area is to the east. Site Features: The ABM site is comprised of 2 parcels located at 400-404 (Tax #117-08-07.0) and 380 (Tax #117-08-06.1) Spencer Street. In total, the parcels are approximately 2.7 acres in size; the West Parcel covers an area of approximately 0.6 acres and the East Parcel is about 2.1 acres. The parcels are separated by Onondaga Creek, which is a tributary to Onondaga Lake. Current Zoning/Use: The West Parcel is currently occupied by a one-story concrete block building that was formerly used as office space and a machinery shop. The East Parcel is vacant land. Historic Use: Site remediation occurred in 2005 and 2006.

AMERICAN BAG AND METAL COMPANY, INC. (Continued)

S107787039

Remediation on the West Parcel included soil excavation and off-site disposal of PCB contaminated soil greater than 10 ppm (parts per million). Remediation on the East Parcel included excavation and off-site disposal of paint waste. An Environmental Easement was filed with the County Clerk on 12/14/2006. A Certificate of Completion (COC) was issued on December 22, 2006. Off-site PCB soil contamination exists and an investigation is being conducted under site no. C734088A.

Env Problem: PCB contamination of soils has been remediated on the West Parcel to 10 ppm subsurface with a 1-foot cover. Off-site PCB contamination exists on the west bank of Onondaga Creek, and potentially to the north and west on City of Syracuse Property. Paint waste contamination has been remediated on the East Parcel. Residual groundwater contamination (VOCs) exists, as well as upgradient groundwater contamination entering the site. A 1-foot soil cover exists. An Environmental Easement was filed with the County Clerk on 12/14/2006. A COC was issued on December 22, 2006.

Health Problem: PCBs and paint wastes were excavated and properly disposed off-site, thereby eliminating the potential for exposure to these wastes. Because groundwater is contaminated with volatile organic compounds, the potential exists for soil vapor intrusion on the east parcel should anyone build there. However, the site management plan requires that an active subslab depressurization system be installed in any new structures built on the east parcel. Exposure to contaminated groundwater is not expected because the area is served by a public water supply and the easement prohibits groundwater use.

 Site Code: 58089
 Site Description: Location:The American Bag and Metal Company Inc. site is located on Spencer Street in the City of Syracuse, Onondaga County, New York. Kirkpatrick Street is to the north of the site, Spencer Street is to the south, the City of Syracuse property is to the west, and an industrial area is to the east. Site Features:The ABM site is comprised of 2 parcels located at 400-404 (Tax #117-08-07.0) and 380 (Tax #117-08-06.1) Spencer Street. In total, the parcels are

AMERICAN BAG AND METAL COMPANY, INC. (Continued) S107787039

approximately 2.7 acres in size; the West Parcel covers an area of approximately 0.6 acres and the East Parcel is about 2.1 acres. The parcels are separated by Onondaga Creek, which is a tributary to Onondaga Lake. Current Zoning/Use: The West Parcel is currently occupied by a one-story concrete block building that was formerly used as office space and a machinery shop. The East Parcel is vacant land. Historic Use:Site remediation occurred in 2005 and 2006. Remediation on the West Parcel included soil excavation and off-site disposal of PCB contaminated soil greater than 10 ppm (parts per million). Remediation on the East Parcel included excavation and off-site disposal of paint waste. An Environmental Easement was filed with the County Clerk on 12/14/2006. A Certificate of Completion (COC) was issued on December 22, 2006. Off-site PCB soil contamination exists and an investigation is being conducted under site no. C734088A.
 Env Problem: PCB contamination of soils has been remediated on the West Parcel to 10 ppm subsurface with a 1-foot cover. Off-site PCB contamination exists on the west bank of Onondaga Creek, and potentially to the north and west on City of Syracuse Property.Paint waste contamination has been remediated on the East Parcel. Residual groundwater contamination (VOCs) exists, as well as upgradient groundwater contamination entering the site. A 1-foot soil cover exists.An Environmental Easement was filed with the County Clerk on 12/14/2006. A COC was issued on December 22, 2006.
 Health Problem: PCBs and paint wastes were excavated and properly disposed off-site, thereby eliminating the potential for exposure to these wastes. Becausegroundwater is contaminated with volatile organic compounds, the potential exists for soil vapor intrusion on the east parcel should anyone buildthere. However, the site management plan requires that an active subslab depressurization system be installed in any new structures built on the east parcel. Exposure to contaminated groundwater is not expected because the area is served by a public water supply and the easement prohibits groundwater use.

 Site Description: Location: The American Bag and Metal Off-Site Site is located in a commercial and urban area surrounding 400 Spencer Street in the City of Syracuse, Onondaga County.Site Features: The site consists of

AMERICAN BAG AND METAL COMPANY, INC. (Continued) S10778039

three parcels. Parcel A (0.28 acres) exists to the west of the American Bag and Metal Brownfields Site, and is owned by the City of Syracuse Department of Parks, Recreation and Youth Programs. A portion of the Onondaga Creekwalk, which leads to the Inner Harbor of Onondaga Lake, is adjacent to, and west of Parcel A. Parcel A is relatively flat and is covered with grass, trees and shrubs. Parcel B (0.04 acres) is a thin strip of land north of the American Bag and Metal Brownfields Site and south of a parking lot and a building owned by the City of Syracuse Department of Parks, Recreation and Youth Programs. This parcel is also owned by the City of Syracuse Department of Parks, Recreation and Youth Programs. Parcel B is relatively flat, and is also covered with grass, trees and shrubs, but to a lesser extent than Parcel A. Parcel C (0.11 acres) is the eastern most parcel located on the west bank of Onondaga Creek, adjacent to the neighboring American Bag and Metal Brownfields Site. Parcel C is owned by New York State. Parcel C is thickly vegetated with trees and brush, and is steeply sloped down to Onondaga Creek. Current Zoning/Uses: The north and west parcels (Parcels A and B, respectively) are owned by the City of Syracuse Department of Parks, Recreation and Youth Programs. Immediately west of Parcel A, is a portion of the Onondaga Creekwalk, and west of the Creekwalk is the Department of Parks, Recreation and Youth Programs main office building. North of Parcel B are buildings such as garages and repair facilities owned by the Department of Parks, Recreation and Youth Programs. Parcels A and B are currently zoned commercial. The east parcel (Parcel C) is the west bank of Onondaga Creek adjacent to the American Bag and Metal Brownfields Site, and is green space. Parcel C is zoned commercial. Historical Uses: In 1922, the area was vacant. FB and H Molding briefly operated on the neighboring ABM Site property from 1905 to 1906, when Harnisch Manufacturer of Interior Decorations took over. In 1940, Syracuse Benzol Co., Inc. Oil and Lubricants operated at the ABM Site property. Onondaga Store Fixture Co., Inc. operated at the ABM Site property from 1955 to 1965. In 1965, American Bag and Metal purchased the property. American Bag and Metal operated from 1965 to 2001. Operations included receiving industrial scrap metals (primarily iron and steel), sorting and grading, storing, and baling of the metals onsite. The metals were then shipped off-site as scrap metal. During December 1991, a soil core was collected in conjunction with the New York State Department of Transportation reconstruction of the Spencer Street bridge, located on Parcel C. Analysis of the core determined that the soils at the Site were contaminated with PCBs. Based upon documentation provided by ABM, the PCB contamination is possibly from transformers processed for scrap metal at the ABM Site. The ABM Site remediation, which included excavation and proper off-site disposal of PCB-contaminated soil, occurred in 2005 and 2006 under the New York State Brownfields Cleanup Program, and a Certificate of Completion was issued on December 22, 2006 by the Department (Site No. C734088). Site Geology and Hydrogeology: Site geology consists of fill from zero to approximately 12 feet below grade. Groundwater occurs at approximately 12 feet below grade and migrates toward Onondaga Creek. Surface runoff from the site discharges to Onondaga Creek, which is adjacent to, and east of, Parcel C.

Nature and Extent of Contamination: Based upon investigations conducted to date, the primary contaminant of concern is PCB Aroclor 1260. PCB Aroclor 1260 was found in shallow soil, on all three site parcels (A, B and C), to depths of approximately 2 to 3 feet below

Env Problem:

AMERICAN BAG AND METAL COMPANY, INC. (Continued) S10778039

ground surface. PCB soil contamination was found on Parcel A (up to 38 ppm), Parcel B (up to 2.6 ppm), and Parcel C (up to 103 ppm). PCBs were not detected in groundwater during the BCP site investigation for the neighboring ABM Site. Special Resources Impacted/Treated: A Fish and Wildlife Impact Analysis (FWIA) was performed during the investigation of the neighboring American Bag and Metal BCP Site and this FWIA was updated during the investigation of the American Bag and Metal Off-Site site. The primary exposure pathway for ecological receptors is through the direct ingestion of soils. The contamination also has the potential to migrate, via erosion, to Onondaga Creek which could impact aquatic biota. However, creek surface water and sediment samples taken from previous investigations do not indicate that the site is currently impacting the creek. The potential exists for contact with contaminated surface soils.

Environmental Interest/Information System
 RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Environmental Interest/Information System
 RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Site Description: The ABM Site is comprised of 2 parcels located at 400-404 (Tax #117.-08-07.0) and 380 (Tax #117.-08-06.1) Spencer Street in the City

S&W REDEVELOPMENT, LLC (Continued) 1008374481

of Syracuse, Onondaga County, New York. The site is surrounded by Kirkpatrick Street (North), Spencer Street (South), the City of Syracuse property (West), and an industrial area (East). The parcels total approximately 2.7 acres in size and are separated by Onondaga Creek, a tributary to Onondaga lake. The West Parcel includes an area of approximately 0.6 acres, and the larger East Parcel includes an area of approximately 2.1 acres. The West Parcel is currently occupied by a one-story concrete block building that was formerly used as office space and a machinery shop. The East Parcel is currently vacant land. On-Site remediation occurred in 2005 and 2006 under the State's Brownfields Cleanup Program (C734088). Remediation on the West Parcel included soil excavation, and off-site disposal, of PCB contaminated soil greater than 10 ppm. Remediation on the East Parcel included excavation and off-site disposal of the paint waste. An Environmental Easement was filed with the County Clerk on 12/14/2006. A COC was issued on December 22, 2006. Off-site of the West Parcel, PCB soil contamination exists and a Decision Document was issued on March 20, 2012 under site No. C734088A. Off-site of the West Parcel, PCB soil contamination exists and a Decision Document was issued on March 20, 2012 under site No. C734088A.

Env Problem: PCB contamination of soils has been confirmed on the West Parcel. Paint waste contamination has been confirmed on the East Parcel in both groundwater and soil. On-Site remediation occurred in 2005 and 2006 under the State's Brownfields Cleanup Program (C734088).

 DEC Memo: **11/25/2013 - Tank G607U failed CP test. Tank G607U previously identified as overdue for annual NYS DEC CP testing during 11/15/2013 PBS inspection. per Lift Safe / Fuel Safe, highest CP values are -0.5 mVish (less than passing threshold of -0.850 mV), and St. Joseph's will most likely remove tank rather than repair CP system. Tank tightness test required by Part 613.5(b)(2) to be performed next week. KCKemp 1/8/2014 - Tank to be replaced week of 1/13/2014 by Lift Safe Fuel Safe. Consent order issued for PBS 7-140309. 3/31/2014 - Closure report received and filed. Spill closed. KCKemp

FINDS:

Registry ID: 110001600688

Environmental Interest/Information System

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

FIS (New York - Facility Information System) is New York's Department of Environmental Conservation (DEC) information system for tracking environmental facility information found across the State.

HAZARDOUS WASTE BIENNIAL REPORTER

ICIS (Integrated Compliance Information System) is the Integrated Compliance Information System and provides a database that, when complete, will contain integrated Enforcement and Compliance information across most of EPA's programs. The vision for ICIS is to replace EPA's independent databases that contain Enforcement data with a single repository for that information. Currently, ICIS contains all Federal Administrative and Judicial enforcement actions. This information is maintained in ICIS by EPA in the Regional offices and its Headquarters. A future release of ICIS will replace the Permit Compliance System (PCS) which supports the NPDES and will integrate that information with Federal actions already in the system. ICIS also has the capability to track other activities occurring in the Region

ST JOSEPH'S HOSPITAL HEALTH CENTER (Continued)

1000265652

that support Compliance and Enforcement programs. These include; Incident Tracking, Compliance Assistance, and Compliance Monitoring.

 SWIS: 3415
 Region: 7
 Town: Syracuse (c)
 Acres: 0.33
 Record Added: 01/09/2007
 Record Updated: 02/19/2014
 Updated By: HDWARNER
 Site Description: The site consists of approximately 0.33 acres which includes an unoccupied three-story brick and stone building constructed in approximately 1900. The building was initially occupied by the Thomas Ryan Consumers Brewing Company from 1900 to 1924. Thereafter, various businesses used the site as a storage and trucking facility from the 1930s up until 1981, after which time Otisca Industries utilized the building for research and development of "Otisca Fuel", a petroleum fuel alternative using coal-based slurry as a primary source. A preliminary investigation conducted on behalf of the City of Syracuse revealed several 55-gallon drums containing coal/water slurry by-products along with approximately 200 gallons of laboratory chemicals. A structural survey performed on behalf of the City in the fall of 2007 concluded that the roof and one or more of the interior floors are in danger of collapse. Given these conditions and the presence of unsecured chemicals on the first floor and in the basement, the USEPA was contacted in February 2008 by the Department to perform an Emergency Removal Action. Operations were performed between May and September 2008, and included the cataloging and removal of thousands of various lab chemicals by a USEPA contractor. All chemicals of concern were removed and disposed. No further action was deemed necessary. The City of Syracuse withdrew from the ERP in the spring of 2009. No further action site is no longer an ERP.
 Env Problem: The City of Syracuse observed some roof and upper floor damage in the on-site structure in the summer of 2007 and had a structural survey conducted later that fall. The survey indicated that the structural integrity of the roof and the 3rd and 2nd floors was compromised. Given the presence of unsecured chemicals on the first floor and in the basement of the building, the matter was referred to the USEPA in February 2008 for an Emergency Removal Action. Emergency Response Action Conducted May to September 2008. Thousands (vials) of lab chemicals recovered along with ~250 tons of Pea-coal removed from the basement. USEPA contractor removed all chemicals of concern. No further Action required. City of Syracuse withdrew from ERP program Spring 2009.

 Updated By: AMOMOROC
 Site Description: Location: The NM-Erie Boulevard MGP Site is located in an urban area in the City of Syracuse, Onondaga County. The site is bounded by West Genesee Street to the north, North Franklin Street to the east and Erie Boulevard West to the south. The site is owned by Niagara Mohawk Power Corporation (NM), doing business as National Grid. Site Features: Onondaga Creek borders the site on the west. The seven acre former MGP site is within the 10 acre National Grid facility, consisting of five occupied office buildings. The remaining site area is covered with paved parking lots and roadways. Site access is restricted to the general public by perimeter fencing, locking gates, and an onsite security service. Current Zoning/Use(s): The site is zoned for commercial use. The site is occupied by five buildings comprising the National Grid Syracuse Office Complex. The immediate surrounding area is zoned for commercial and central business use. Past Use of the Site: The prior uses of the site include three mills (a saw mill, a saw mill, a linseed oil mill) and a tannery. The first manufactured gas plant (MGP) was constructed in 1849 and operated until the 1930s. During World War 1 (1917 to 1918) the plant produced toluol used for the manufacture of dynamite at another location. Site Geology and Hydrogeology: Fill material is present below the asphalt pavement surface cover and ranges in thickness from 3 to 28 feet. The fill unit is underlain by a clay/silt layer. This unit is discontinuous and ranges in thickness from 2 to 22 feet. A sand and gravel unit is encountered beneath the clay/silt layer at depths ranging from 6 to 30 feet below ground surface (bgs). The water table is generally encountered at a depth of approximately 20 feet bgs at the site and flows from south to north. The site is adjacent to Onondaga Creek, which is a losing stream at this location, meaning that water flows from the creek into groundwater. Groundwater is naturally very saline, which renders it unsuitable for potable purposes.

Env Problem: This section summarizes the assessment of existing and potential future environmental impacts presented by the site. Environmental impacts may include existing and potential future exposure pathways to fish and wildlife receptors, wetlands, groundwater resources, and surface water. Based upon the resources and pathways identified and the toxicity of the contaminants of ecological concern at this site, a Fish and Wildlife Resources Impact Analysis (FWRIA) was deemed not necessary. The specific VOCs of concern for the site are benzene, toluene, ethylbenzene, and xylenes. These are collectively referred to as BTEX in this document. SVOCs of concern are the polycyclic aromatic hydrocarbons (PAHs). Total PAH concentrations referred to in this document are the sum of individual PAH compounds. The inorganic

NATIONAL GRID MAIN OFFICE (Continued) S111065346

contaminant of concern is cyanide in the form of iron-cyanide salts. Groundwater: The primary contaminants of concern related to MGP processes include benzene, toluene, ethylbenzene and xylenes (BTEX), polycyclic aromatic hydrocarbons (PAHs), and metals. Remedial investigations indicate a deep contaminated groundwater plume of BTEX and naphthalene, with past maximum concentrations of 20,700 ppb and 15,000 ppb respectively, flows off-site, under Onondaga Creek and toward the northwest and has migrated approximately 2,000 feet down gradient of the site. The prior high concentrations were found on-site near the former MGP structures, and have decreased over the years, with more recent levels of BTEX and naphthalene of 11,390 ppb and 2,800 ppb, respectively. Soil: Subsurface soil has been impacted primarily in the western part of the site in the vicinity of the former MGP operations. This area is largely covered by a parking lot and is limited to the on-site area. The lateral extent of MGP impacts to shallow groundwater is limited to the immediate vicinity of the former MGP structures. Coal tar was observed in several soil borings, and test pits located onsite, primarily in the western parking lot. However, there has been no accumulation of free-phase light or dense non-aqueous phase liquid (LNAPL or DNAPL) observed in any of the monitoring wells on-site or down gradient of the site. The upper 8 to 10 feet of soil is not impacted by coal tar as shown in most of the soil borings. Soil Vapor: As part of the Supplemental Remedial Investigation field investigations, soil vapor samples were collected from 30 sampling locations onsite. Several volatile organic compounds (VOCs), including BTEX and naphthalene, were identified in soil vapor samples collected from each sampling location. Overall, the VOC concentrations detected were relatively low, with the majority of the results ranging from non-detect to 10 micrograms per cubic meter (µg/m³). Sub-slab vapor and indoor air samples were collected to evaluate the vapor intrusion exposure pathway. While some VOCs were identified in the sub-slab vapor samples, MGP related VOCs were not identified in any of the indoor air samples at concentrations exceeding typical background indoor air values. Non-MGP related VOCs (methylene chloride and trichloroethylene) were identified at two indoor air sampling locations at concentrations slightly greater than typical background indoor air values, but the concentrations at those sampling locations were less than NYSDOH published air guideline values. The presence of methylene chloride and trichloroethylene in indoor air was attributed to operational use of products inside the buildings (not the former MGP). The results do not indicate a need for further investigation or remedial actions for this environmental media. Surface Water: Analysis of surface water samples collected from Onondaga Creek did not contain detectable levels of VOCs and SVOCs. While some metals were detected in the surface water samples, they were not attributable to the site. Cyanide was not detected in any of the surface water samples. Sediment: Sediment samples were collected from 26 locations in Onondaga Creek upstream, adjacent to, and downstream of the site, and analyzed for VOCs, SVOCs, inorganic constituents (including cyanide), PCBs, and pesticides. The analytical results indicate that VOCs were either not detected in sediment, or were detected at very low concentrations were low (1 ppb or less). SVOCs were identified upstream, adjacent to, and downstream of the site. The presence of PAHs in sediment samples upstream of the site and the heavily urbanized nature of the surrounding area indicated that there are current sources of PAHs impacting the creek sediments that are unrelated to the site. Cyanide compounds were not

NATIONAL GRID MAIN OFFICE (Continued)

S111065346

identified in any of the sediment samples. Certain metals and pesticides were detected in the sediment samples, but are unrelated to the site.

Health Problem: Since the site is covered by asphalt, fill or site buildings, people will not come into contact with soil and groundwater contamination unless they dig below the surface. People are not drinking the groundwater because the area is served by a public water supply not affected by site contamination.

- Biennial Reports:
 Last Biennial Reporting Year: 2013
- Annual Waste Handled:
 Waste code: D001
 Waste name: IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.
 Amount (Lbs): 2421
- Waste code: D002
 Waste name: A WASTE WHICH HAS A PH OF LESS THAN 2 OR GREATER THAN 12.5 IS CONSIDERED TO BE A CORROSIVE HAZARDOUS WASTE. SODIUM HYDROXIDE, A CAUSTIC SOLUTION WITH A HIGH PH, IS OFTEN USED BY INDUSTRIES TO CLEAN OR DEGREASE PARTS. HYDROCHLORIC ACID, A SOLUTION WITH A LOW PH, IS USED BY MANY INDUSTRIES TO CLEAN METAL PARTS PRIOR TO PAINTING. WHEN

NATIONAL GRID DEWEY AVE SVC CTR (Continued)

Event: Igration of Contaminated Groundwater under Control, Yes, Migration of Contaminated Groundwater Under Control has been verified. Based on a review of information contained in the EI determination, it has been determined that migration of contaminated groundwater is under control at the facility. Specifically, this determination indicates that the migration of contaminated groundwater is under control, and that monitoring will be conducted to confirm that contaminated groundwater remains within the existing area of contaminated groundwater. This determination will be re-evaluated when the Agency becomes aware of significant changes at the facility.

 Site Description:

Location: The McKesson Envirosystems Site is located at 800/801 Van Rensselaer Street West in the City of Syracuse, Onondaga County, New York. It is located to the south of Onondaga Lake, adjacent to the west bank of the New York State Barge Canal Terminal channel. Site Features: The site was formerly used for bulk storage of petroleum products and in later years, as storage for a variety of chemical waste streams. The site is approximately 8.6 acres in size and is separated by Van Rensselaer Street into two parcels. The parcel north of Van Rensselaer Street is within 150 feet of the Barge Canal. The largest of the former above ground storage tanks (Tank 7) was located on this portion of the site. The majority of previous material storage and handling took place in the area south of Van Rensselaer Street, where ten former above ground storage tanks were located. The site is generally flat with a grass cover. It is fenced and access is restricted to authorized persons only. Current Zoning/Use(s): The McKesson property was zoned for industrial use but is now in a newly established Lakefront District, in a zone labeled T5 Urban Center district. This area is to be developed to be a business district and residential, primarily apartment type dwellings. The site is within one-quarter mile of Onondaga Lake, which is a major surface water body in the greater Syracuse area. Land use in the surrounding area is characterized as IB - Industrial District Class B, in areas north and northwest, and northeast is designated PK (Civic Space Recreation). The area to the south is designated T4 General Urban District. Past Use(s) of the Site: This facility was used since the 1930s as a bulk petroleum distribution terminal for products such as gasoline, diesel fuel, heating oil, etc. In 1973, the facility was converted to a chemical distribution terminal. The storage tanks were used for temporary staging of spent solvents that were acquired for recycling, for recycled solvents that were returned by customers, and also for storing mixtures and by-products. The staging was associated with solvent recycling operations through-out the northeast. During the time the facility was in operation, liquids were spilled on the ground and the tanks leaked. Evidence of contaminated soil from spilled liquids was noted by DEC personnel during site inspections. 1920's: Occupied by various salt companies. 1928-1969: Petroleum Storage Facility (ARCO), Tanks 1-6 (South Parcel) 1951: Tank 7 installed (North Parcel) 1969-1973: Petroleum Storage Facility BP Oil Company (BP) 1973: Inland Chemical Corporation (ICC) purchases site from BP Oil Company for recycling waste streams and chemical storage including: methanol, methylene chloride and other solvents. 1980: ICC filed a Part A Permit Application for Interim status as a hazardous waste storage facility under the Resource Conservation Recovery Act (RCRA). 1982: ICC operations discontinued. 1987: Revised Part A application for closure submitted

MCKESSON ENVIROSYSTEMS (Continued)

1000222268

to NYSDEC. Remediation Consent Order signed 6/10/87. 1988: Operational Unit 01B-McKesson Corporation submitted a RCRA closure plan entitled "Verification of Aboveground Storage Tank Decontamination Protocol" to NYSDEC. 1989: Operational Unit 01B-RCRA Closure certification is submitted to NYSDEC. Aboveground tanks removed from the site. 1990: Notification from NYSDEC that facility was officially closed and that corrective actions would proceed under the Remediation Consent Order which was amended to include both McKesson Corporation and Safety-Kleen Envirosystems Company as Respondents. The Final Remedial Investigation Report was issued in April 1990. The RI revealed significant soil and groundwater contamination. A PAH Distribution Report was issued at the same time. Site Geology and Hydrogeology: The soil stratigraphy is relatively consistent across the site. The surface fill material consists of the unsaturated soil addressed by the OLU remedy with overlying sand and gravel cover placed as a component of the remedy. The surface fill is underlain by silt and clay ranging in depth from approximately 8 to 15 feet below ground surface (bgs), followed by a layer of sand and silt from approximately 15 to 22 feet bgs. A silt and clay lacustrine deposit is present across the entire site at approximately 22 to 24 feet bgs. Underlying the lacustrine silt and clay are varying compositions of sand and gravel to approximately 62 feet bgs. Depth to bedrock is approximately 350 feet or a little greater at this location, based on other area studies. The three flow systems identified beneath the Bear Street site are: a deep flow system (24 to 62 feet bgs) in the unconsolidated deposits beneath the confining layer, an intermediate flow system in the lower soil unit, and a shallow flow system (15-22 feet bgs) in the upper and middle soil units. The intermediate flow system, in the lower soil unit, can be separated into a freshwater zone and a saltwater zone. It is reported that groundwater in this zone is and has historically been unusable as a potable source due to its high chloride concentrations. Both the shallow and intermediate flow systems are influenced by seasonal or transient conditions including precipitation, ponding water and subsequent infiltration within the impoundments, and the water elevation of the Barge Canal. The discharge point for the shallow and intermediate flow systems is to the northeast, the Barge Canal, and the discharge point for the deep flow system appears to be Onondaga Lake.

Env Problem:

Prior to remediation: Soils: The unsaturated soils addressed by Operable Unit 01 at this site are those approximately four feet in depth which lie above the groundwater elevation. These soils have been contaminated with materials previously stored in tanks at the site. The soils at the site are contaminated with the COCs identified above. Non-halogenated aromatics (benzene, toluene, ethylbenzene, and xylene) are frequently detected in association with petroleum products (primarily gasoline). Chlorinated aliphatic compounds are commonly used as solvents. They include the following compounds detected at this site: tetrachloroethene (PCE), trichloroethene (TCE), trans-1,2-dichloroethene (1,1,2-DCE), methylene chloride, and vinyl chloride. The dimethylamine-related compounds observed at the site are aniline and N,N-dimethylaniline. Acetone, methanol, and chlorobenzene are also present at the site which do not fit into the other classes of chemicals. In general, the chemicals of concern were detected near the former materials loading area and the former locations of the aboveground storage tanks. Groundwater: The groundwater quality results indicate the presence of chemical compounds at concentrations above groundwater quality standards. The

MCKESSON ENVIROSYSTEMS (Continued)

1000222268

identified chemicals in groundwater are: methylene chloride, trichloroethene, benzene, toluene, ethylbenzene, xylene, N,N-dimethylaniline, aniline, trans-1,2-dichloroethene, methanol, and acetone. Groundwater data from the RI, the Supplemental Sampling program and semi-annual monitoring events indicate that COCs, though present in on-site groundwater have not, with only one exception (aniline at 7 ppb), migrated beyond the site property boundaries. This off-site contaminant "hit" was detected during the August 1996 semi-annual sampling event. While RI information may indicate limited migration of contamination toward the Barge Canal, groundwater information from the Supplemental Investigation supported that the concentration and areal distribution of COCs in groundwater seemed to have decreased in comparison to historic (RI) data. Investigation data also supports that contamination is generally confined to the shallow hydrogeologic unit. This was evidenced by the lack of groundwater standard contravention in samples from the deep well points installed during the Supplemental Investigation. Furthermore, within the deeper hydrogeologic unit there is a freshwater/saltwater interface. This interface exists at a depth of approximately 35 feet bgs. The groundwater in this deeper unit has historically been unusable for drinking because of its high chloride concentrations. Post-Remediation: A Record of Decision (ROD) was issued on March 18, 1994, and called for bioremediation of the unsaturated soils in the area referred to as Operable Unit-1 (OU-1). The bioremediation successfully treated an estimated 20,000 cubic yards of contaminated soil. The saturated soils and groundwater at the site have been designated as OU-2. A PRP funded Feasibility Study was completed in 1996. A Record of Decision (ROD) was signed on March 15, 1997. Design and construction of an anaerobic bioremediation system was completed in early 1998. Based on the process control monitoring data obtained in 2002, the in situ anaerobic bioremediation treatment process is meeting the remedial goals for OU No. 2 presented in the ROD April 10, 2013 the anaerobic system was shutdown due to asymptotic levels of contamination in the groundwater and no detection of contamination in the down gradient monitoring wells. The system was temporarily shutdown and will be evaluated after 2 years to determine that there is no rebound and the down gradient monitoring wells continue to have no detection of contamination. Long-term site management is ongoing.

Health Problem:

The site is fenced. However, since some contaminated soils remain at the site below clean backfill, people will not come into contact with contaminated soils unless they dig below the surface materials. People are not drinking the groundwater because the area is served by a public water supply not affected by site contamination. Volatile organic compounds in the groundwater may move into bedrock fissures and the soil vapor (air spaces within the soil), which in turn may move into overlying buildings and affect the indoor air quality. This process, which is similar to the movement of radon gas from the subsurface into the indoor air of buildings, is referred to as soil vapor intrusion. Currently there are no occupied buildings on the site. An evaluation of the potential for soil vapor intrusion to occur will be completed should the current use of the site change.

 Site Description: Location: The McKesson Envirosystems Site is located at 800/801 Van Rensselaer Street West in the City of Syracuse, Onondaga County, New York. It is located to the south of Onondaga Lake, adjacent to the west bank of the New York State Barge Canal Terminal channel. Site Features: The site was formerly used for bulk storage of petroleum products and in later years, as storage for a variety of chemical waste streams. The site is approximately 8.8 acres in size and is separated by Van Rensselaer Street into two parcels. The parcel north of Van Rensselaer Street is within 150 feet of the Barge Canal. The largest of the former above ground storage tanks (Tank 7) was located on this portion of the site. The majority of previous material storage and handling took place in the area south of Van Rensselaer Street, where ten former above ground storage tanks were located. The site is generally flat with a grass cover. It is fenced and access is restricted to authorized persons only. Current Zoning Use(s): The McKesson property was zoned for industrial use but is now in a newly established Lakefront District, in a zone labeled T5 Urban Center district. This area is to be developed to be a business district and residential, primarily apartment type dwellings. The site is within one-quarter mile of Onondaga Lake, which is a major surface water body in the greater Syracuse area. Land use in the surrounding area is characterized as IB - Industrial District Class B, in areas north and northwest, and northeast is designated PK (Civic Space Recreation). The area to the south is designated T4 General Urban District. Past Use(s) of the Site: This facility was used since the 1930s as a bulk petroleum distribution terminal for products such as gasoline, diesel fuel, heating oil, etc. In 1973, the facility was converted to a chemical distribution terminal. The storage tanks were used for temporary staging of spent solvents that were acquired for recycling, for recycled solvents that were returned by customers, and also for storing mixtures and by-products. The staging was associated with solvent recycling operations through-out the northeast. During the time the facility was in operation, liquids were spilled on the ground and the tanks leaked. Evidence of contaminated soil from spilled liquids was noted by DEC personnel during site inspections. 1920's: Occupied by various salt companies. 1928-1969: Petroleum Storage Facility (ARCO). Tanks 1-6 (South Parcel)/1951: Tank 7 installed (North Parcel)/1969-1973: Petroleum Storage Facility BP Oil Company (BP)/1973: Inland Chemical Corporation (ICC) purchases site from BP Oil Company for recycling waste streams and chemical storage including: methanol, methylene chloride and other solvents. 1980: ICC filed a Part A Permit Application for interim status as a hazardous waste storage facility under the Resource Conservation Recovery Act (RCRA). 1982: ICC operations

The storage tanks were used for temporary staging of spent solvents that were acquired for recycling, for recycled solvents that were returned by customers, and also for storing mixtures and by-products. The staging was associated with solvent recycling operations through-out the northeast. During the time the facility was in operation, liquids were spilled on the ground and the tanks leaked. Evidence of contaminated soil from spilled liquids was noted by DEC personnel during site inspections. 1920's: Occupied by various salt companies. 1928-1969: Petroleum Storage Facility (ARCO), Tanks 1-6 (South Parcel) 1951: Tank 7 installed (North Parcel) 1969-1973: Petroleum Storage Facility BP Oil Company (BP) 1973: Inland Chemical Corporation (ICC) purchases site from BP Oil Company for recycling waste streams and chemical storage including: methanol, methylene chloride and other solvents. 1980: ICC filed a Part A Permit Application for interim status as a hazardous waste storage facility under the Resource Conservation Recovery Act (RCRA). 1982: ICC operations discontinued. 1987: Revised part A application for closure submitted to NYSDEC. Remediation Consent Order signed 6/10/87. 1988: Operational Unit 01B-McKesson Corporation submitted a RCRA closure plan entitled "Verification of Aboveground Storage Tank Decontamination Protocol" to NYSDEC. 1989: Operational Unit 01B-RCRA Closure certification is submitted to NYSDEC. Aboveground tanks removed from the site. 1990: Notification from NYSDEC that facility was officially closed and that corrective actions would proceed under the Remediation Consent Order which was amended to include both McKesson Corporation and Safety-Kleen Envirosystems Company as Respondents. The Final Remedial Investigation Report was issued in April 1990. The RI revealed significant soil and groundwater contamination. A PAH Distribution Report was issued at the same time. Site Geology and Hydrogeology: The soil stratigraphy is relatively consistent across the site. The surface fill material consists of the unsaturated soil

MCKESSON ENVIROSYSTEMS (Continued)

100022268

addressed by the OU-1 remedy with overlying sand and gravel cover placed as a component of the remedy. The surface fill is underlain by silt and clay ranging in depth from approximately 8 to 15 feet below ground surface (bgs), followed by a layer of sand and silt from approximately 15 to 22 feet bgs. A silt and clay lacustrine deposit is present across the entire site at approximately 22 to 24 feet bgs. Underlying the lacustrine silt and clay are varying compositions of sand and gravel to approximately 62 feet bgs. Depth to bedrock is approximately 350 feet or a little greater at this location, based on other area studies. The three flow systems identified beneath the Bear Street site are: a deep flow system (24 to 62 feet bgs) in the unconsolidated deposits beneath the confining layer, an intermediate flow system in the lower soil unit, and a shallow flow system (15-22 feet bgs) in the upper and middle soil units. The intermediate flow system, in the lower soil unit, can be separated into a freshwater zone and saltwater zone. It is reported that groundwater in this zone is and has historically been unusable as a potable source due to its high chloride concentrations. Both the shallow and intermediate flow systems are influenced by seasonal or transient conditions including precipitation, ponding water and subsequent infiltration within the impoundments, and the water elevation of the Barge Canal. The discharge point for the shallow and intermediate flow systems is to the northeast, the Barge Canal, and the discharge point for the deep flow system appears to be Onondaga Lake.

Env Problem:

Prior to remediation: Soils: The unsaturated soils addressed by Operable Unit 01 at this site are those approximately four feet in depth which lie above the groundwater elevation. These soils have been contaminated with materials previously stored in tanks at the site. The soils at the site are contaminated with the COCs identified above. Non-halogenated aromatics (benzene, toluene, ethylbenzene, and xylenes) are frequently detected in association with petroleum products (primarily gasoline). Chlorinated aliphatic compounds are commonly used as solvents. They include the following compounds detected at this site: tetrachloroethene (PCE), trichloroethene (TCE), trans-1,2-dichloroethene (t-1,2-DCE), methylene chloride, and vinyl chloride. The dimethylaniline-related compounds observed at the site are aniline and N,N-dimethylaniline. Acetone, methanol, and chlorobenzene are also present at the site which do not fit into the other classes of chemicals. In general, the chemicals of concern were detected near the former materials loading area and the former locations of the aboveground storage tanks. Groundwater: The groundwater quality results indicate the presence of chemical compounds at concentrations above groundwater quality standards. The identified chemicals in groundwater are: methylene chloride, trichloroethene, benzene, toluene, ethylbenzene, xylenes, N,N-dimethylaniline, aniline, trans-1,2-dichloroethene, methanol, and acetone. Groundwater data from the RI, the Supplemental Sampling program and semi-annual monitoring events indicate that COCs, though present in on-site groundwater have not, with only one exception (aniline at 7 ppb), migrated beyond the site property boundaries. This off-site contaminant "hit", was detected during the August 1996 semi-annual sampling event. While RI information may indicate limited migration of contamination toward the Barge Canal, groundwater information from the Supplemental Investigation supported that the concentration and areal distribution of COCs in groundwater seemed to have decreased in comparison to historic (RI) data. Investigation data also supports that contamination is generally

MCKESSON ENVIROSYSTEMS (Continued)

100022268

confined to the shallow hydrogeologic unit. This was evidenced by the lack of groundwater standard contravention in samples from the deep well points installed during the Supplemental Investigation. Furthermore, within the deeper hydrogeologic unit there is a freshwater/saltwater interface. This interface exists at a depth of approximately 35 feet bgs. The groundwater in this deeper unit has historically been unusable for drinking because of its high chloride concentrations. Post-Remediation: A Record of Decision (ROD) was issued on March 18, 1994, and called for bioremediation of the unsaturated soils in the area referred to as Operable Unit-1 (OU-1). The bioremediation successfully treated an estimated 20,000 cubic yards of contaminated soil. The saturated soils and groundwater at the site have been designated as OU-2. A PRP-funded Feasibility Study was completed in 1996. A Record of Decision (ROD) was signed on March 15, 1997. Design and construction of an anaerobic bioremediation system was completed in early 1998. Based on the process control monitoring data obtained in 2002, the initial anaerobic bioremediation treatment process is meeting the remedial goals for OU No. 2 presented in the ROD. April 10, 2013 the anaerobic system was shutdown due to asymptotic levels of contamination in the groundwater and no detection of contamination in the down gradient monitoring wells. The system was temporarily shutdown and will be evaluated after 2 years to determine that there is no rebound and the down gradient monitoring wells continue to have no detection of contamination. Long-term site management is ongoing.

Health Problem:

The site is fenced. However, since some contaminated soils remain at the site below clean backfill, people will not come into contact with contaminated soils unless they dig below the surface materials. People are not drinking the groundwater because the area is served by a public water supply not affected by site contamination. Volatile organic compounds in the groundwater may move into bedrock fissures and the soil vapor (air spaces within the soil), which in turn may move into overlying buildings and affect the indoor air quality. This process, which is similar to the movement of radon gas from the subsurface into the indoor air of buildings, is referred to as soil vapor intrusion. Currently there are no occupied buildings on the site. An evaluation of the potential for soil vapor intrusion to occur will be completed should the current use of the site change.

Site Description: Location: The McKesson Envirosystems Site is located at 800/801 Van Rensselaer Street West in the City of Syracuse, Onondaga County, New York. It is located to the south of Onondaga Lake, adjacent to the west bank of the New York State Barge Canal Terminal channel. Site Features: The site was formerly used for bulk storage of petroleum products and in later years, as storage for a variety of chemical waste streams. The site is approximately 8.8 acres in size and is separated by Van Rensselaer Street into two parcels. The parcel north of Van Rensselaer Street is within 150 feet of the Barge Canal. The

MCKESSON ENVIROSYSTEMS (Continued)

100022268

largest of the former above ground storage tanks (Tank 7) was located on this portion of the site. The majority of previous material storage and handling took place in the area south of Van Rensselaer Street, where ten former above ground storage tanks were located. The site is generally flat with a grass cover. It is fenced and access is restricted to authorized persons only. Current Zoning/Use(s): The McKesson property was zoned for industrial use but is now in a newly established Lakefront District, in a zone labeled T5 Urban Center district. This area is to be developed to be a business district and residential, primarily apartment type dwellings. The site is within one-quarter mile of Onondaga Lake, which is a major surface water body in the greater Syracuse area. Land use in the surrounding area is characterized as IB - Industrial District Class B, in areas north and northwest, and northeast is designated PK (Civic Space/ Recreation). The area to the south is designated T4 General Urban District. Past Use(s) of the Site: This facility was used since the 1930s as a bulk petroleum distribution terminal for products such as gasoline, diesel fuel, heating oil, etc. In 1973, the facility was converted to a chemical distribution terminal. The storage tanks were used for temporary staging of spent solvents that were acquired for recycling, for recycled solvents that were returned by customers, and also for storing mixtures and by-products. The staging was associated with solvent recycling operations through-out the northeast. During the time the facility was in operation, liquids were spilled on the ground and the tanks leaked. discharge point for the shallow and intermediate flow systems is to the northeast, the Barge Canal, and the discharge point for the deep flow system appears to be Onondaga Lake. Prior to remediation: Soils: The unsaturated soils addressed by Operable Unit 01 at this site are those approximately four feet in depth which lie above the groundwater elevation. These soils have been contaminated with materials previously stored in tanks at the site. The soils at the site are contaminated with the COCs identified above. Non-halogenated aromatics (benzene, toluene, ethylbenzene, and xylenes) are frequently detected in association with petroleum products (primarily gasoline). Chlorinated aliphatic compounds are commonly used as solvents. They include the following compounds detected at this site: tetrachloroethene (PCE), trichloroethene (TCE), trans-1,2-dichloroethene (1,2-DCE), methylene chloride, and vinyl chloride. The dimethylaniline-related compounds observed at the site are aniline and N,N-dimethylaniline. Acetone, methanol, and chlorobenzene are also present at the site which do not fit into the other classes of chemicals. In general, the chemicals of concern were detected near the former materials loading area and the former locations of the aboveground storage tanks.Groundwater: The groundwater quality results indicate the presence of chemical compounds at concentrations above groundwater quality standards. The identified chemicals in groundwater are: methylene chloride, trichloroethene, benzene, toluene, ethylbenzene, xylenes, N,N-dimethylaniline, aniline, trans-1,2-dichloroethene, methanol, and acetone. Groundwater data from the RI, the Supplemental Sampling program and semi-annual monitoring events indicate that COCs, though present in on-site groundwater have not, with only one exception (aniline at 7 ppb), migrated beyond the site property boundaries. This off-site contaminant "leakage" was detected during the August 1996 semi-annual sampling event.While RI information may indicate limited migration of contamination toward the Barge Canal, groundwater information from the Supplemental Investigation supported that the concentration and areal distribution of COCs in groundwater seemed to have decreased in comparison to historic (RI) data. Investigation data also supports that contamination is generally confined to the shallow hydrogeologic unit. This was evidenced by the lack of groundwater standard contamination in samples from the deep well points installed during the Supplemental Investigation. Furthermore, within the deeper hydrogeologic unit there is a freshwater/saltwater interface. This interface exists at a depth of approximately 35 feet bgs. The groundwater in this deeper unit has historically been unusable for drinking because of its high chloride concentrations.Post-Remediation: A Record of Decision (ROD) was issued on March 18, 1994, and called for bioremediation of the unsaturated soils in the area referred to as Operable Unit-1 (OU-1). The bioremediation successfully treated an estimated 20,000 cubic yards of contaminated soil. The saturated soils and groundwater at the site have been designated as OU-2. A PRP funded Feasibility Study was completed in 1996. A Record of Decision (ROD) was signed on March 15, 1997. Design and construction of an anaerobic bioremediation system was completed in early 1998. Based on the process control monitoring data obtained in 2002, the in situ anaerobic bioremediation treatment process is meeting the remedial goals for OU No. 2 presented in the ROD.April 10, 2013 the anaerobic system was shutdown due to asymptotic levels of contamination in the groundwater and no detection of contamination in the down gradient monitoring wells. The

TC4679337.2s Page 635

MCKESSON ENVIROSYSTEMS (Continued)

100022268

system was temporarily shutdown and will be evaluated after 2 years to determine that there is no rebound and the down gradient monitoring wells continue to have no detection of contamination. Long-term site management is ongoing. Health Problem: The site is fenced. However, since some contaminated soils remain at the site below clean backfill, people will not come into contact with contaminated soils unless they dig below the surface materials. People are not drinking the groundwater because the area is served by a public water supply not affected by site contamination. Volatile organic compounds in the ground water may move into bedrock fissures and the soil vapor (air spaces within the soil), which in turn may move into overlying buildings and affect the indoor air quality. This process, which is similar to the movement of radon gas from the subsurface into the indoor air of buildings, is referred to as soil vapor intrusion. Current buildings on the site. An evaluation of the potential for soil vapor intrusion to occur will be completed should the current use of the site change. Site Code: 56333 Control Name: Landuse Restriction HW Code: 734020 Control Code: 25 Control Type: INST Dt record added: 12/14/2010 Dt rec updated: 6/1/2016 Updated By: PDLONG Site Code: 56333 Site Description: Location: The McKesson Environments Site is located at 800/801 Van Rensselaer Street West in the City of Syracuse, Onondaga County, New York. It is located to the south of Onondaga Lake, adjacent to the west bank of the New York State Barge Canal Terminal channel.Site Features: The site was formerly used for bulk storage of petroleum products and in later years, as storage for a variety of chemical waste streams. The site is approximately 8.8 acres in size and is separated by Van Rensselaer Street into two parcels. The parcel north of Van Rensselaer Street is within 150 feet of the Barge Canal. The largest of the former above ground storage tanks (Tank 7) was located on this portion of the site. The majority of previous material storage and handling took place in the area south of Van Rensselaer Street, where ten former above ground storage tanks were located. The site is generally flat with a grass cover. It is fenced and access is restricted to authorized persons only.Current Zoning/Use(s): The McKesson property was zoned for industrial use but is now in a newly established Lakemont District, in a zone labeled T5 Urban Center district. This area is to be developed to be a business district and residential, primarily apartment type dwellings. The site is within one-quarter mile of Onondaga Lake, which is a major surface water body in the greater Syracuse area. Land use in the surrounding area is characterized as IB - Industrial District Class B, in areas north and northwest, and northeast is designated PK (Civic Space Recreation). The area to the south is designated T4 General Urban District.Past Use(s) of the Site: This facility was used since the 1930s as a bulk petroleum distribution terminal for products such as gasoline, diesel fuel, heating oil, etc. In 1973, the facility was converted to a chemical distribution terminal. The storage tanks were used for temporary staging of spent solvents that were acquired for recycling, for recycled solvents that were returned by customers, and

TC4679337.2s Page 636

MCKESSON ENVIROSYSTEMS (Continued)

100022268

Env Problem:

also for storing mixtures and by-products. The staging was associated with solvent recycling operations through-out the northeast. During the time the facility was in operation, liquids were spilled on the ground and the tanks leaked. Evidence of contaminated soil from spilled liquids was noted by DEC personnel during site inspections.1920's: Occupied by various salt companies.1928-1969: Petroleum Storage Facility (ARCO), Tanks 1-6 (South Parcel)1951: Tank 7 installed (North Parcel)1969-1973: Petroleum Storage Facility BP Oil Company (BP)1973: Inland Chemical Corporation (ICC) purchases site from BP Oil Company for recycling waste streams and chemical storage including: methanol, methylene chloride and other solvents.1980: ICC filed a Part A Permit Application for interim status as a hazardous waste storage facility under the Resource Conservation Recovery Act (RCRA).1982: ICC operations discontinued.1987: Revised part A application for closure submitted to NYSDEC. Remediation Consent Order signed 6/10/87.1988: Operational Unit 01B-Mckesson Corporation submitted a RCRA closure plan entitled "Verification of Aboveground Storage Tank Decontamination Protocol"and submitted to NYSDEC.1989: Operational Unit 01B-RCRA Closure certification is submitted to NYSDEC. Aboveground tanks removed from the site.1990: Notification from NYSDEC that facility was officially closed and that corrective actions would proceed under the Remediation Consent Order which was amended to include both McKesson Corporation and Safety-Kleen Environments Company as Respondents. The Final Remedial Investigation Report was issued in April 1990. The RI revealed significant soil and groundwater contamination. A PAH Distribution Report was issued at the same time.Site Geology and Hydrogeology: The soil stratigraphy is relatively consistent across the site. The surface fill material consists of the unsaturated soil addressed by the OU-I remedy with overlying sand and gravel cover placed as a component of the remedy. The surface fill is underlain by silt and clay ranging in depth from approximately 8 to 15 feet below ground surface (bgs), followed by a layer of sand and silt from approximately 15 to 22 feet bgs. A silt and clay lacustrine deposit is present across the entire site at approximately 22 to 24 feet bgs. Underlying the lacustrine silt and clay are varying compositions of sand and gravel to approximately 62 feet bgs. Depth to bedrock is approximately 350 feet or a little greater at this location, based on other area studies.The three flow systems identified beneath the Bear Street site are: a deep flow system (24 to 62 feet bgs) in the unsolidated deposits beneath the confining layer, an intermediate flow system in the lower soil unit, and a shallow flow system (15-22 feet bgs) in the upper and middle soil units. The intermediate flow system, in the lower soil unit, can be separated into a freshwater zone and saltwater zone. It is reported that groundwater in this zone is and has historically been unusable as a potable source due to its high chloride concentrations.Both the shallow and intermediate flow systems are influenced by seasonal or transient conditions including precipitation, ponding water and subsequent infiltration within the impoundments, and the water elevation of the Barge Canal. The discharge point for the shallow and intermediate flow systems is to the northeast, the Barge Canal, and the discharge point for the deep flow system appears to be Onondaga Lake. Prior to remediation: Soils: The unsaturated soils addressed by Operable Unit 01 at this site are those approximately four feet in depth which lie above the groundwater elevation. Site Geology and Hydrogeology: The soil stratigraphy is relatively consistent across the site. The surface fill material consists of the unsaturated soil addressed by the OU-I remedy with overlying sand and gravel cover placed as a component of the remedy. The surface fill is underlain by silt and clay ranging in depth from approximately 8 to 15 feet below ground surface (bgs), followed by a layer of sand and silt from approximately 15 to 22 feet bgs. A silt and clay lacustrine deposit is present across the entire site at approximately 22 to 24 feet bgs. Underlying the lacustrine silt and clay are varying compositions of sand and gravel to approximately 62 feet bgs. Depth to bedrock is approximately 350 feet or a little greater at this location, based on other area studies. The three flow systems identified beneath the Bear Street site are: a deep flow system (24 to 62 feet bgs) in the unconsolidated deposits beneath the confining layer, an intermediate flow system in the lower soil unit, and a shallow flow system (15-22 feet bgs) in the upper and middle soil units. The intermediate flow system, in the lower soil unit, can be separated into a freshwater zone and saltwater zone. It is reported that groundwater in this zone is and has historically been unusable as a potable source due to its high chloride concentrations. Both the shallow and intermediate flow systems are influenced by seasonal or transient conditions including precipitation, ponding water and subsequent infiltration within the impoundments, and the water elevation of the Barge Canal. The discharge point for the shallow and intermediate flow systems is to the northeast, the Barge Canal, and the discharge point for the deep flow system appears to be Onondaga Lake. Prior to remediation: Soils: The unsaturated soils addressed by Operable Unit 01 at this site are those approximately four feet in depth which lie above the groundwater elevation. These soils have been contaminated with materials previously stored in tanks at the site. The soils at the site are contaminated with the COCs identified above. Non-halogenated aromatics (benzene, toluene, ethylbenzene, and xylenes) are frequently detected in association with petroleum products (primarily gasoline). Chlorinated aliphatic compounds are commonly used as solvents. They include the following compounds detected at this site: tetrachloroethene (PCE), trichloroethene (TCE), trans-1,2-dichloroethene (1,2-DCE), methylene chloride, and vinyl chloride. The dimethylaniline-related compounds observed at the site are aniline and N,N-dimethylaniline. Acetone, methanol, and chlorobenzene are also present at the site which do not fit into the other classes of chemicals. In general, the chemicals of concern were detected near the former materials loading area and the former locations of the aboveground storage tanks. Groundwater: The groundwater quality results indicate the presence of chemical

Env Problem:

MCKESSON ENVIROSYSTEMS (Continued)

100022268

compounds at concentrations above groundwater quality standards. The identified chemicals in groundwater are: methylene chloride, trichloroethene, benzene, toluene, ethylbenzene, xylenes, N,N-dimethylaniline, aniline, trans-1,2-dichloroethene, methanol, and acetone. Groundwater data from the RI, the Supplemental Sampling program and semi-annual monitoring events indicate that COCs, though present in on-site groundwater have not, with only one exception (aniline at 7 ppb), migrated beyond the site property boundaries. This off-site contaminant "leakage" was detected during the August 1996 semi-annual sampling event. While RI information may indicate limited migration of contamination toward the Barge Canal, groundwater information from the Supplemental Investigation supported that the concentration and areal distribution of COCs in groundwater seemed to have decreased in comparison to historic (RI) data. Investigation data also supports that contamination is generally confined to the shallow hydrogeologic unit. This was evidenced by the lack of groundwater standard contravention in samples from the deep well points installed during the Supplemental Investigation. Furthermore, within the deeper hydrogeologic unit there is a freshwater/saltwater interface. This interface exists at a depth of approximately 35 feet bgs. The groundwater in this deeper unit has historically been unusable for drinking because of its high chloride concentrations. Post-Remediation: A Record of Decision (ROD) was issued on March 18, 1994, and called for bioremediation of the unsaturated soils in the area referred to as Operable Unit-1 (OU-1). The bioremediation successfully treated an estimated 20,000 cubic yards of contaminated soil. The saturated soils and groundwater at the site have been designated as OU-2. A PRP funded Feasibility Study was completed in 1996. A Record of Decision (ROD) was signed on March 15, 1997. Design and construction of an anaerobic bioremediation system was completed in early 1998. Based on the process control monitoring data obtained in 2002, the insitu anaerobic bioremediation treatment process is meeting the remedial goals for OU No. 2 presented in the ROD. April 10, 2013 the anaerobic system was shutdown due to asymptotic levels of contamination in the groundwater and no detection of contamination in the down gradient monitoring wells. The system was temporarily shutdown and will be evaluated after 2 years to determine that there is no rebound and the down gradient monitoring wells continue to have no detection of contamination. Long-term site management is ongoing. Health Problem: The site is fenced. However, since some contaminated soils remain at the site below clean backfill, people will not come into contact with contaminated soils unless they dig below the surface materials. People are not drinking the groundwater because the area is served by a public water supply not affected by site contamination. Volatile organic compounds in the groundwater may move into bedrock fissures and the soil vapor (air spaces within the soil), which in turn may move into overlying buildings and affect the indoor air quality. This process, which is similar to the movement of radon gas from the subsurface into the indoor air of buildings, is referred to as soil vapor intrusion. Currently there are no occupied buildings on the site. An evaluation of the potential for soil vapor intrusion to occur will be completed should the current use of the site change.

 Site Code: 56333
 Site Description: Location: The McKesson Envirosystems Site is located at 800/801 Van Rensselaer Street West in the City of Syracuse, Onondaga County, New York. It is located to the south of Onondaga Lake, adjacent to the west bank of the New York State Barge Canal Terminal channel. Site Features: The site was formerly used for bulk storage of petroleum products and in later years, as storage for a variety of chemical waste streams. The site is approximately 8.8 acres in size and is separated by Van Rensselaer Street into two parcels. The parcel north of Van Rensselaer Street is within 150 feet of the Barge Canal. The largest of the former above ground storage tanks (Tank 7) was located on this portion of the site. The majority of previous material storage and handling took place in the area south of Van Rensselaer Street, where ten former above ground storage tanks were located. The site is generally flat with a grass cover. It is fenced and access is restricted to authorized persons only. Current Zoning/Use(s): The McKesson property was zoned for industrial use but is now in a newly established Lakefront District, in a zone labeled T5 Urban Center district. This area is to be developed to be a business district and residential, primarily apartment type dwellings. The site is within one-quarter mile of Onondaga Lake, which is a major surface water body in the greater Syracuse area. Land use in the surrounding area is characterized as IB - Industrial District Class B, in areas north and northwest, and northeast is designated PK (Civic Space Recreation). The area to the south is designated T4 General Urban District. Past Use(s) of the Site: This facility was used since the 1930s as a bulk petroleum distribution terminal for products such as gasoline, diesel fuel, heating oil, etc. In 1973, the facility was converted to a chemical distribution terminal. The storage tanks were used for temporary staging of spent solvents that were acquired for recycling, for recycled solvents that were returned by customers, and also for storing mixtures and by-products. The staging was associated with solvent recycling operations through-out the northeast. During the time the facility was in operation, liquids were spilled on the ground and the tanks leaked. Evidence of contaminated soil from spilled liquids was noted by DEC personnel during site inspections. 1920's: Occupied by various salt companies. 1928-1969: Petroleum Storage Facility (ARCO), Tanks 1-6 (South Parcel) 1951: Tank 7 installed (North Parcel) 1969-1973: Petroleum Storage Facility BP Oil Company (BP) 1973: Inland Chemical Corporation (ICC) purchases site from BP Oil Company for recycling waste streams and chemical storage including: methanol, methylene chloride and other solvents. 1980: ICC filed a Part A Permit Application for interim status as a hazardous waste storage facility under the Resource Conservation Recovery Act (RCRA). 1982: ICC operations discontinued. 1987: Revised part A application for closure submitted to NYSDEC. Remediation Consent Order signed 6/10/87. 1988: Operational Unit 01B-McKesson Corporation submitted a RCRA closure plan entitled "Verification of Aboveground Storage Tank Decontamination Protocol" to NYSDEC. 1989: Operational Unit 01B-RCRA Closure certification is submitted to NYSDEC. Aboveground tanks removed from the site. 1990: Notification from NYSDEC that facility was officially

MCKESSON ENVIROSYSTEMS (Continued)

100022268

closed and that corrective actions would proceed under the Remediation Consent Order which was amended to include both McKesson Corporation and Safety-Kleen Environments Company as Respondents. The Final Remedial Investigation Report was issued in April 1990. The RI revealed significant soil and groundwater contamination. A PAH Distribution Report was issued at the same time. Site Geology and Hydrogeology: The soil stratigraphy is relatively consistent across the site. The surface fill material consists of the unsaturated soil addressed by the OU-1 remedy with overlying sand and gravel cover placed as a component of the remedy. The surface fill is underlain by silt and clay ranging in depth from approximately 8 to 15 feet below ground surface (bgs), followed by a layer of sand and silt from approximately 15 to 22 feet bgs. A silt and clay lacustrine deposit is present across the entire site at approximately 22 to 24 feet bgs. Underlying the lacustrine silt and clay are varying compositions of sand and gravel to approximately 62 feet bgs. Depth to bedrock is approximately 350 feet or a little greater at this location, based on other area studies. The three flow systems identified beneath the Bear Street site are: a deep flow system (24 to 62 feet bgs) in the unconsolidated deposits beneath the confining layer, an intermediate flow system in the lower soil unit, and a shallow flow system (15-22 feet bgs) in the upper and middle soil units. The intermediate flow system, in the lower soil unit, can be separated into a freshwater zone and saltwater zone. It is reported that groundwater in this zone is and has historically been unusable as a potable source due to its high chloride concentrations. Both the shallow and intermediate flow systems are influenced by seasonal or transient conditions including precipitation, ponding water and subsequent infiltration within the impoundments, and the water elevation of the Barge Canal. The discharge point for the shallow and intermediate flow systems is to the northeast, the Barge Canal, and the discharge point for the deep flow system appears to be Onondaga Lake.

Env Problem: Prior to remediation: Soils: The unsaturated soils addressed by Operable Unit 01 at this site are those approximately four feet in depth which lie above the groundwater elevation. These soils have been contaminated with materials previously stored in tanks at the site. The soils at the site are contaminated with the COCs identified above. Non-halogenated aromatics (benzene, toluene, ethylbenzene, and xylenes) are frequently detected in association with petroleum products (primarily gasoline). Chlorinated aliphatic compounds are commonly used as solvents. They include the following compounds detected at this site: tetrachloroethene (PCE), trichloroethene (TCE), trans-1,2-dichloroethene (1,2-DCE), methylene chloride, and vinyl chloride. The dimethylaniline-related compounds observed at the site are aniline and N,N-dimethylaniline. Acetone, methanol, and chlorobenzene are also present at the site which do not fit into the other classes of chemicals. In general, the chemicals of concern were detected near the former materials loading area and the former locations of the aboveground storage tanks. Groundwater: The groundwater quality results indicate the presence of chemical compounds at concentrations above groundwater quality standards. The identified chemicals in groundwater are: methylene chloride, trichloroethene, benzene, toluene, ethylbenzene, xylenes, N,N-dimethylaniline, aniline, trans-1,2-dichloroethene, methanol, and acetone. Groundwater data from the RI, the Supplemental Sampling program and semi-annual monitoring events indicate that COCs, though present in on-site groundwater have not, with only one exception

MCKESSON ENVIROSYSTEMS (Continued)

100022268

(aniline at 7 ppb), migrated beyond the site property boundaries. This off-site contaminant "hit" was detected during the August 1996 semi-annual sampling event. While RI information may indicate limited migration of contamination toward the Barge Canal, groundwater information from the Supplemental investigation supported that the concentration and areal distribution of COCs in groundwater seemed to have decreased in comparison to historic (RI) data. Investigation data also supports that contamination is generally confined to the shallow hydrogeologic unit. This was evidenced by the lack of groundwater standard contravention in samples from the deep well points installed during the Supplemental investigation. Furthermore, within the deeper hydrogeologic unit there is a freshwater/saltwater interface. This interface exists at a depth of approximately 35 feet bgs. The groundwater in this deeper unit has historically been unusable for drinking because of its high chloride concentrations. Post-Remediation: A Record of Decision (ROD) was issued on March 18, 1994, and called for bioremediation of the unsaturated soils in the area referred to as Operable Unit-1 (OU-1). The bioremediation successfully treated an estimated 20,000 cubic yards of contaminated soil. The saturated soils and groundwater at the site have been designated as OU-2. A PRP funded Feasibility Study was completed in 1996. A Record of Decision (ROD) was signed on March 15, 1997. Design and construction of an anaerobic bioremediation system was completed in early 1998. Based on the process control monitoring data obtained in 2002, the in situ anaerobic bioremediation treatment process is meeting the remedial goals for OU No. 2 presented in the ROD. April 10, 2013 the anaerobic system was shutdown due to asymptotic levels of contamination in the groundwater and no detection of contamination in the down gradient monitoring wells. The system was temporarily shutdown and will be evaluated after 2 years to determine that there is no rebound and the down gradient monitoring wells continue to have no detection of contamination. Long-term site management is ongoing.

Health Problem: The site is fenced. However, since some contaminated soils remain at the site below clean backfill, people will not come into contact with contaminated soils unless they dig below the surface materials. People are not drinking the groundwater because the area is served by a public water supply not affected by site contamination. Volatile organic compounds in the groundwater may move into bedrock fissures and the soil vapor (air spaces within the soil), which in turn may move into overlying buildings and affect the indoor air quality. This process, which is similar to the movement of radon gas from the subsurface into the indoor air of buildings, is referred to as soil vapor intrusion. Currently there are no occupied buildings on the site. An evaluation of the potential for soil vapor intrusion to occur will be completed should the current use of the site change.

Event: Certification Of Remedy Completion Or Construction Completion
Event date: 04/30/1998
Event: CA770GW
Event date: 06/24/1999
Event: CA Prioritization, Facility or area was assigned a medium corrective action priority.
Event date: 09/26/2000
Event: Igration of Contaminated Groundwater under Control, Yes, Migration of Contaminated Groundwater Under Control has been verified. Based on a review of information contained in the EI determination, it has been determined that migration of contaminated groundwater is under control at the facility. Specifically, this determination indicates that the migration of contaminated groundwater is under control, and that monitoring will be concluded to confirm that contaminated groundwater remains within the existing area of contaminated groundwater. This determination will be re-evaluated when the Agency becomes aware of significant changes at the facility.
Event date: 09/26/2000
Event: Current Human Exposures under Control, Yes, Current Human Exposures Under Control has been verified. Based on a review of information contained in the EI determination, current human exposures are expected to be under control at the facility under current and reasonably expected conditions. This determination will be re-evaluated when the Agency/State becomes aware of significant changes at the facility.

Environmental Interest/Information System
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Site Description: Location: The Lower Ley Creek Site is located in an urban area in the Town of Salina, Onondaga County. The site consists of the lower two miles of Ley Creek beginning at the crossing of Ley Creek by Route 11 (a.k.a. Brewerton Road) and ending downstream at the mouth of Ley Creek at Onondaga Lake. Site Features: The main site features include the creek and creek sediments. Current Zoning and Land Use: Ley Creek is a Class C stream from the mouth of the creek to a point approximately 1.3 miles upstream of the mouth. Upstream of this point, Ley Creek is a Class B stream. The land surrounding Lower Ley Creek is mostly industrial. The surrounding area contains numerous industries, roads, bridges, railroad tracks and businesses. Lower Ley Creek also flows adjacent to two landfills. The creek itself is not used commercially. The site was listed on the National Priorities List (NPL) in July 2010 as a sub-site to the Onondaga Lake NPL Site. Past Use of the Site: Prior to the early 1970s, poor channel

LOWER LEY CREEK (Continued)

S11391671

conditions and large impermeable areas in the vicinity of the creek caused extensive flooding of Ley Creek. In an effort to alleviate flooding, Ley Creek was dredged in the 1970s, and the dredged material was placed along the banks of the creek. Prior to 1938, the area was generally used for agriculture. Site Geology and Hydrogeology: The soils surrounding the site consist of glacial origin deposits including fill, outwash, alluvial and glacio-lacustrine sediments. Above the unconsolidated soils in some areas near the site are fill deposits of cinders, ash and Solvay waste. Human activities have altered the natural soil surrounding most of the site, and most of the original soils are no longer found. The stream sediments are generally soft with little stone. Much of the stream is shallow, but there are pockets of sediment that exist to depths of 8-10 feet deep. Water flows in a south-westerly direction to Onondaga Lake. Ley Creek accounts for approximately 8% of the total water inflow to the lake. Groundwater discharge accounts for approximately 35% of the stream flow in Ley Creek.

Env Problem: Contaminant levels in sediment exceed the severe effect limits for aquatic plants and animals. EPA sampling in 2010 and 2011 has shown the presence of PCBs at hazardous waste levels in both the sediments and soils. In addition, sediment sampling showed levels of heavy metals exceeding the DEC Fish Kamp, Wildlife Severe Effect Levels (SEL). For example, chromium was found at a concentration of 6,290 ppm, well above the SEL of 110 ppm. Access to this site is unrestricted, and the property is next to a public thoroughfare. The site poses a significant threat to fish and wildlife. The June 2013 RI performed by EPA determined that PCBs are the major contaminant of concern in the sediment and soil at the site. An EPA ROD was issued for the site on September 30, 2014. The ROD, in part, called for sediment removal to PCB concentrations of 1 ppm PCB in the creek, and soil excavation to 1 ppm PCB in the top 2 feet and 10 ppm PCB below 2 feet.

Health Problem: People are not drinking contaminants in the creek water because the area is served by a public water supply that obtains its water from a different source. People may come in contact with contaminants in creek water and/or shallow sediments while entering or exiting the creek during recreational activities. Contact with site-related contamination along the creek banks and in nearby soil is minimized because the areas are well vegetated with grass and brush. However, people may still come in contact with site-related contaminants in these areas if they dig below the surface. Currently, there is a health advisory for people to limit their consumption of fish from the creek.

Site Description: Location: The Crouse-Hinds Landfills Site consists of two inactive landfills, referred to as the North and South Landfills. The Site is located in the Town of Salina (North Landfill) and City of Syracuse (South Landfill), Onondaga County, New York. The North Landfill is bordered along its northern border by vacant land owned by Plaza East, LLC. This vacant land to the north of the North Landfill consists of areas of fill (municipal waste and miscellaneous debris) with woodland cover and wetlands. The North Landfill is bordered to the east by CSX railroad tracks followed by the Cooper Crouse-Hinds manufacturing facility. Seventh North Street followed by the South Landfill border the North Landfill to the south. West of the North Landfill are wetlands, also owned by Plaza East, followed by Ley Creek. The South Landfill is bordered to the north by Seventh North Street followed by the North Landfill. To the east, the South Landfill is bordered by CSX railroad tracks. Undeveloped woods, wetlands and mixed commercial and retail development border the South Landfill to the south. Ley Creek abuts the entire west and northwest boundary of the South Landfill. Site Features: The North Landfill is 21.5 acres in size, and the South Landfill is 19.4 acres in size. Seventh North Street is oriented southeast-northwest and separates the two landfills that comprise the site. Adjacent to the North Landfill are on-site wetlands to the east and west, along with an on-site drainage channel to the east. Adjacent to the South Landfill are on-site wetlands to the south and an on-site drainage channel to

NY SHWS S101008535

NY Spills

CROUSE-HINDS (Continued)

S101008535

the east. Current Zoning: The Site is currently zoned industrial and is located in an area of mixed usage including light industrial/manufacturing and commercial. Historical Use: Prior to the mid-to-late 1950s the North and South Landfills areas had been occupied by low lying fields, salt marshes and woodlands. From the mid-1950s to 1989 fill material was placed across various areas of the North and South Landfills. Beginning in the mid-1950s, the North Landfill was used for disposal of industrial wastes that were generated at the Crouse-Hinds manufacturing facility. Wastes disposed of in the North Landfill include: foundry sand, floor sweepings, metal buffing and polishing residue, scrap lumber, plastic wastes and paint scrapings, all originating from the facility. Zinc hydroxide sludge generated from the facility's wastewater treatment plant was also disposed of in the North Landfill from 1972 to 1980. Waste disposal was discontinued at the North Landfill in 1989, and it has been inactive since. In 1960, the company began using the South Landfill for disposal of industrial wastes that were generated at the Cooper Crouse-Hinds, LLC manufacturing facility. These wastes included: foundry molds and core sand, scrap steel drums and shot, fly ash, paint scrapings, garbage and construction and demolition debris. In addition to disposal of wastes by the facility, from 1960 to 1965, the South Landfill also accepted approximately 2,000 cubic yards per week of municipal solid waste from the City of Syracuse. Waste disposal activities were discontinued at the South Landfill in 1969, and the South Landfill has been inactive ever since that time. Site Geology and Hydrogeology: The site geology consists of unconsolidated glaciolacustrine and glacioluvial sediments as described below. A shallow groundwater flow system, located from approximately 6 to 30 feet below the ground surface, in the fill, peat, sand and silt deposits, and a deep confined groundwater flow system located in sand and gravel deposits are present at the site. The deep groundwater system is separated from the overlying shallow groundwater system by a continuous confining layer of silt and clay deposits of varying thickness commencing at approximately 30 feet below ground surface. Groundwater flow in the shallow groundwater system is generally to the west toward Ley Creek. Groundwater flow in the deep groundwater flow system is generally to the east. Groundwater in the deep aquifer exhibits a strong upward vertical gradient and at times exhibits artesian conditions in the deep wells located on the North Landfill.

Env Problem: No threatened or endangered plant or animal species were observed on the Crouse-Hinds Landfills Site or are believed to inhabit the site. The site supports vegetation and wildlife consistent with terrestrial, wetland and stream corridor cover types. Contaminants of concern were detected at concentration levels exceeding relevant ecological criteria in shallow and subsurface soil, on-site sediment, surface water and groundwater at the site. While contaminants of concern were detected in the sediment and surface water in Ley Creek, the data demonstrate that the current impacts to Ley Creek are not attributable to the site. Rather, sampling has shown that upstream sources, not associated with this site, are impacting the creek. For example, lead in Ley Creek surface water was detected at concentrations in excess of the New York State surface water quality standard (17.9 ppb) adjacent to the site; however, the highest concentration detected in Ley Creek during the RI was at the upgradient sampling location (84.2 ppb). In addition, sediment concentrations of PAHs, PCBs and metals generally remain consistent

CROUSE-HINDS (Continued)

S101008535

from upstream of the landfills to downstream of the landfills indicating that the site is not significantly impacting Ley Creek. Complete and potentially ecologically-significant pathways to wildlife receptors were identified for each of the media (soil, sediment, groundwater and surface water) sampled at the site. The site is unpaved and exhibits a potential pathway to wildlife receptors through the erosion of contaminated surface soils to onsite wetlands and drainage channels. Contaminated sediment erosion to Ley Creek is minimized by sediment check dams in a drainage channel to the wetland east of the North Landfill and by the prior removal of a 36-inch culvert from a drainage channel between Ley Creek and the wetland adjacent to the South Landfill. Both soil and waste provide a complete pathway to burrowing wildlife. Surface water and sediments in drainage channels and wetlands at the site provide a complete pathway to aquatic organisms and their predators. Surface water runoff to Ley Creek provides a potential pathway to aquatic organisms and their predators. Groundwater seepage to surface water onsite provides a potential pathway to aquatic organisms.

Health Problem: People are not drinking the contaminated groundwater because the area is served by a public water supply that is not affected by site-related contamination. Also, they are not coming into contact with the groundwater unless they dig deeper than six feet below the ground surface. The potential for direct contact with contaminated surface soils identified in isolated areas of the site is minimized by vegetation that covers the site. People are not expected to come into direct contact with contaminated soil (dirt) or sediment unless they dig below the ground surface or waste through creek and/or wetland sediment. Volatile organic compounds in the groundwater may move into the soil vapor (air spaces within the soil), which in turn may move into overlying buildings and affect the indoor air quality. This process, which is similar to the movement of radon gas from the subsurface into the indoor air of buildings, is referred to as soil vapor intrusion. Because the site is vacant, the inhalation of site-related contaminants due to soil vapor intrusion does not represent a concern for the site in its current condition. However, the potential exists for people to inhale site-related contaminants in indoor air due to soil vapor intrusion in any future on-site building development and occupancy. An evaluation of the potential for soil vapor intrusion to occur will be completed should the current use of the site change.

SHWS:
 Program: HW
 Site Code: 58628
 Classification: Site is properly closed - requires continued management.
 Region: 7
 Acres: 0.413
 HW Code: 734013
 Record Add: 11/18/1999
 Record Upd: 05/27/2015
 Updated By: HDWARNER
 Site Description: Location: The 0.413 site is located on the northeastern edge of the former Oswego Canal at 2802-2810 Lodi Street in Syracuse, Onondaga County. Site Features: The Oswego Canal, closed in the early 1900s, was located where Lodi Street and Oswego Boulevard are currently situated and is now filled with eight to ten feet of non-native material. To the southwest lies Interstate 81 at an elevation approximately 18 feet below the general site grade. Current Zoning/Use: The site is zoned for industrial use by the City of Syracuse. The site is surrounded by other industrial and commercial properties which are also zoned industrial and/or commercial. The site is presently not used. Historic Use: The site was formerly a waste oil recycling facility that operated from 1920 to 1981. Originally the property consisted of three cinder block buildings, surface and underground oil storage tanks, drum and container storage areas, and underground sumps. The facility was operated by many different companies over the years, including Seitz Oil Products, Anchor Oil (Northeast Oil Services), Ag-Met Oil Service, Newton Refining, Hudson Oil, The Portland Holding Corporation and Quanta Resources. Quanta Resources went bankrupt in 1981 and abandoned the site, leaving behind a large volume of product and waste material. Site Geology and Hydrogeology: The site stratigraphy consists of a surficial layer of non-native fill material consisting of sand and gravel with bricks, concrete chunks, glass and wood debris. This unit is typically three to four feet thick, generally pervious and will readily allow rainwater infiltration. Underlying the fill unit is a dense gray-green silt unit that is widely perforated by plant roots. The permeability of the silt is lower than the overlying soils. This unit varies in thickness from zero to 11 feet. The underlying bedrock is Vernon shale, which varies in color from green to gray to red. Drilling logs for the site monitoring wells show the top of the surface of the Vernon shale to be heavily weathered, indicating the rock is fragmented and capable of transmitting water in this weathered zone. The water table has been observed at depths between 22 to 30 feet below ground surface. Based

QUANTA RESOURCES SITE USEPA REGION 2 (Continued)

1000321851

on the drilling logs, the water table surface is below the surface of the weathered Vernon shale. Groundwater flow is generally to the south with a westward component of flow in the northern portion of the site.

Env Problem: Nature and Extent of Contamination/Wastes and source areas were identified at the site, including free-phase oil in subsurface soils above the silt layer. In addition, a light non-aqueous phase liquid (LNAPL) with PCB concentrations in excess of 50 parts per million is present on the water table within the shale. The migration of the LNAPL is limited to the east and west, as evidenced by the lack of LNAPL in off-site monitoring wells. An underground storage tank (UST) filled with an oil-water mixture was also discovered during the RI. Groundwater samples were collected from bedrock monitoring wells to assess groundwater conditions on- and off-site. The results indicate that contamination in groundwater at the site exceeds the SCSs for volatile organic compounds (VOCs), inorganic compounds (i.e., metals) and PCBs. The primary groundwater contaminants are MEK, benzene, toluene and xylene (BTX), and PCBs associated with operation of the former waste oil recycling facility. The inorganic compounds found in groundwater were limited to a single detection (lead, cyanide), or were also found in upgradient monitoring wells (manganese) and are considered to be representative of site background conditions. Therefore, they are not considered site-specific contaminants of concern. Surface and subsurface soil samples were collected at the site. Surface soil samples were collected from a depth of zero to two inches to assess direct human exposure. Subsurface soil samples were collected from a depth of two to 36 feet to assess soil contamination impacts to groundwater. The results indicate that soils at the site exceed the unrestricted SCG for VOCs, semi-volatile organic compounds (SVOCs), metals and PCBs. The primary soil contaminants are VOCs, SVOCs and PCBs associated with operation of the former waste oil recycling facility. Metals contamination in soil is most likely naturally occurring, with some probable contribution from historical urban fill activity. Therefore, metals are not considered site-specific contaminants of concern. Soil vapor samples were collected from the subsurface across the property to assess the potential for soil vapor intrusion. Trichloroethene (TCE) was found in a single soil vapor sample, which was located near the north property boundary within ten feet of a suspected area of historical solvent usage in the adjacent automotive repair facility. The presence of TCE across the site in soil and groundwater samples was rare. Post-Remediation Remediation at the site is complete. Prior to remediation, the primary contaminants of concern were VOCs, SVOCs and PCBs in soil; MEK, benzene, toluene and xylene (BTX), and PCBs in groundwater. Remedial actions have successfully achieved soil cleanup objectives for industrial use. Residual contamination including light non-aqueous phase liquid (LNAPL) with PCB concentrations in excess of 50 parts per million in the groundwater, is being managed under a Site Management Plan.

Health Problem: People are not drinking the contaminated groundwater because the area is served by a public water supply that is not affected by site-related contamination. Since the site is fenced and covered with gravel, people will not come into contact with site-related soil and groundwater contamination unless they dig below the ground surface. Volatile organic compounds in the groundwater may move into the soil vapor (air spaces within the soil), which in turn may move into overlying buildings and affect the indoor air quality. This

MAP FINDINGS

QUANTA RESOURCES SITE USEPA REGION 2 (Continued)

1000321851

process, which is similar to the movement of radon gas from the subsurface into the indoor air of buildings, is referred to as soil vapor intrusion. Because the site is vacant, the inhalation of site-related contaminants due to soil vapor intrusion does not represent a concern for the site in its current condition. However, the potential exists for the inhalation of site contaminants due to soil vapor intrusion for any future on-site redevelopment and occupancy. In addition, sampling indicates that soil vapor intrusion is not a concern for off-site buildings.

The primary groundwater contaminants are MEK, benzene, toluene and xylene (BTX), and PCBs associated with operation of the former waste oil recycling facility. The inorganic compounds found in groundwater were limited to a single detection (lead, cyanide), or were also found in upgradient monitoring wells (manganese) and are considered to be representative of site background conditions. Therefore, they are not considered site-specific contaminants of concern. Surface and subsurface soil samples were collected at the site. Surface soil samples were collected from a depth of zero to two inches to assess direct human exposure. Subsurface soil samples were collected from a depth of two to 36 feet to assess soil contamination impacts to groundwater. The results indicate that soils at the site exceed the unrestricted SCG for VOCs, semi-volatile organic compounds (SVOCs), metals and PCBs. The primary soil contaminants are VOCs, SVOCs and PCBs associated with operation of the former waste oil recycling facility. Metals contamination in soil is most likely

QUANTA RESOURCES SITE USEPA REGION 2 (Continued)

1000321851

naturally occurring, with some probable contribution from historical urban fill activity. Therefore, metals are not considered site-specific contaminants of concern. Soil vapor samples were collected from the subsurface across the property to assess the potential for soil vapor intrusion. Trichloroethene (TCE) was found in a single soil vapor sample, which was located near the north property boundary within ten feet of a suspected area of historical solvent usage in the adjacent automotive repair facility. The presence of TCE across the site in soil and groundwater samples was rare. Post-Remediation Remediation at the site is complete. Prior to remediation, the primary contaminants of concern were VOCs, SVOCs and PCBs in soil, MEK, benzene, toluene and xylene (BTX), and PCBs in groundwater. Remedial actions have successfully achieved soil cleanup objectives for industrial use. Residual contamination including light non-aqueous phase liquid (LNAPL) with PCB concentrations in excess of 50 parts per million in the groundwater is being managed under a Site Management Plan.

Health Problem: People are not drinking the contaminated groundwater because the area is served by a public water supply that is not affected by site-related contamination. Since the site is fenced and covered with gravel, people will not come into contact with site-related soil and groundwater contamination unless they dig below the ground surface. Volatile organic compounds in the groundwater may move into the soil vapor (air spaces within the soil), which in turn may move into overlying buildings and affect the indoor air quality. This process, which is similar to the movement of radon gas from the subsurface into the indoor air of buildings, is referred to as soil vapor intrusion. Because the site is vacant, the inhalation of site-related contaminants due to soil vapor intrusion does not represent a concern for the site in its current condition. However, the potential exists for the inhalation of site contaminants due to soil vapor intrusion for any future on-site redevelopment and occupancy. In addition, sampling indicates that soil vapor intrusion is not a concern for off-site buildings.

 Site Code: 58626
 Site Description: Location: The 0.413 site is located on the northeastern edge of the former Oswego Canal at 2802-2810 Lodi Street in Syracuse, Onondaga County. Site Features: The Oswego Canal, closed in the early 1900s, was located where Lodi Street and Oswego Boulevard are currently situated and is now filled with eight to ten feet of non-native material. To the southwest lies Interstate 81 at an elevation approximately 18 feet below the general site grade. Current Zoning/Use: The site is zoned for industrial use by the City of Syracuse. The site is surrounded by other industrial and commercial properties which are also zoned industrial and/or commercial. The site is presently not used. Historic Use: The site was formerly a waste oil recycling facility that operated from 1920 to 1981. Originally the property consisted of three cinder block buildings.

QUANTA RESOURCES SITE USEPA REGION 2 (Continued)

1000321851

surface and underground oil storage tanks, drum and container storage areas, and underground sumps. The facility was operated by many different companies over the years, including Seitz Oil Products, Anchor Oil (Northeast Oil Services), Ag-Met Oil Service, Newton Refining, Hudson Oil, The Portland Holding Corporation and Quanta Resources. Quanta Resources went bankrupt in 1981 and abandoned the site, leaving behind a large volume of product and waste material. Site Geology and Hydrogeology: The site stratigraphy consists of a surficial layer of non-native fill material consisting of sand and gravel with bricks, concrete chunks, glass and wood debris. This unit is typically three to four feet thick, generally pervious and will readily allow rainwater infiltration. Underlying the fill unit is a dense gray-green silt unit that is widely perforated by plant roots. The permeability of the silt is lower than the overlying soils. This unit varies in thickness from zero to 11 feet. The underlying bedrock is Vernon shale, which varies in color from green to gray to red. Drilling logs for the site monitoring wells show the top of the surface of the Vernon shale to be heavily weathered, indicating the rock is fragmented and capable of transmitting water in this weathered zone. The water table has been observed at depths between 22 to 30 feet below ground surface. Based on the drilling logs, the water table surface is below the surface of the weathered Vernon shale. Groundwater flow is generally to the south with a westward component of flow in the northern portion of the site.

Env Problem: Nature and Extent of Contamination: Wastes and source areas were identified at the site, including free-phase oil in subsurface soils above the silt layer. In addition, a light non-aqueous phase liquid (LNAPL) with PCB concentrations in excess of 50 parts per million is present on the water table within the shale. The migration of the LNAPL is limited to the east and west, as evidenced by the lack of LNAPL in off-site monitoring wells. An underground storage tank (UST) filled with an oil-water mixture was also discovered during the RI. Groundwater samples were collected from bedrock monitoring wells to assess groundwater conditions on- and off-site. The results indicate that contamination in groundwater at the site exceeds the SCGs for volatile organic compounds (VOCs), inorganic compounds (i.e., metals) and PCBs. The primary groundwater contaminants are MEK, benzene, toluene and xylene (BTX), and PCBs associated with operation of the former waste oil recycling facility. The inorganic compounds found in groundwater were limited to a single detection (lead, cyanide), or were also found in upgradient monitoring wells (manganese) and are considered to be representative of site background conditions. Health Problem: gravel, people will not come into contact with site-related soil and groundwater contamination unless they dig below the ground surface. Volatile organic compounds in the groundwater may move into the soil vapor (air spaces within the soil), which in turn may move into overlying buildings and affect the indoor air quality. This process, which is similar to the movement of radon gas from the subsurface into the indoor air of buildings, is referred to as soil vapor intrusion. Because the site is vacant, the inhalation of site-related contaminants due to soil vapor intrusion does not represent a concern for the site in its current condition. However, the potential exists for the inhalation of site contaminants due to soil vapor intrusion for any future on-site redevelopment and occupancy. In addition, sampling indicates that soil vapor intrusion is not a concern for off-site buildings.

 Site Code: 58626
 Site Description: Location: The 0.413 site is located on the northeastern edge of the former Oswego Canal at 2802-2810 Lodi Street in Syracuse, Onondaga County. Site Features: The Oswego Canal, closed in the early 1900s, was located where Lodi Street and Oswego Boulevard are currently situated and is now filled with eight to ten feet of non-native material. To the southwest lies Interstate 81 at an elevation approximately 18 feet below the general site grade. Current Zoning/Use: The site is zoned for industrial use by the City of Syracuse. The site is surrounded by other industrial and commercial properties which are also zoned industrial and/or commercial. The site is presently not used. Historic Use: The site was formerly a waste oil recycling facility that operated from 1920 to 1981. Originally the property consisted of three cinder block buildings, surface and underground oil storage tanks, drum and container storage areas, and underground sumps. The facility was operated by many different companies over the years, including Seitz Oil Products, Anchor Oil (Northeast Oil Services), Ag-Met Oil Service, Newton Refining, Hudson Oil, The Portland Holding Corporation and Quanta Resources. Quanta Resources went bankrupt in 1981 and abandoned the site, leaving behind a large volume of product and waste material. Site Geology and Hydrogeology: The site stratigraphy consists of a surficial layer of non-native fill material consisting of sand and gravel with bricks, concrete chunks, glass and wood debris. This unit is typically three to four feet thick, generally pervious and will readily allow rainwater infiltration. Underlying the fill unit is a dense gray-green silt unit that is widely perforated by plant roots. The permeability of the silt is lower than the overlying soils. This unit varies in thickness from zero to 11 feet. The underlying bedrock is Vernon shale, which varies in color from green to gray to red. Drilling logs for the site monitoring wells show the top of the surface of the Vernon shale to be heavily weathered, indicating the rock is fragmented and capable of transmitting water in this weathered zone. The water table has been

QUANTA RESOURCES SITE USEPA REGION 2 (Continued) 1000321851

Env Problem: observed at depths between 22 to 30 feet below ground surface. Based on the drilling logs, the water table surface is below the surface of the weathered Vernon shale. Groundwater flow is generally to the south with a westward component of flow in the northern portion of the site.

Nature and Extent of Contamination: Wastes and source areas were identified at the site, including free-phase oil in subsurface soils above the silt layer. In addition, a light non-aqueous phase liquid (LNAPL) with PCB concentrations in excess of 50 parts per million is present on the water table within the shale. The migration of the LNAPL is limited to the east and west, as evidenced by the lack of LNAPL in off-site monitoring wells. An underground storage tank (UST) filled with an oil-water mixture was also discovered during the RI. Groundwater samples were collected from bedrock monitoring wells to assess groundwater conditions on- and off-site. The results indicate that contamination in groundwater at the site exceeds the SCGs for volatile organic compounds (VOCs), inorganic compounds (i.e., metals) and PCBs. The primary groundwater contaminants are MEK, benzene, toluene and xylene (BTX), and PCBs associated with operation of the former waste oil recycling facility. The inorganic compounds found in groundwater were limited to a single detection (lead, cyanide), or were also found in upgradient monitoring wells (manganese) and are considered to be representative of site background conditions. Therefore, they are not considered site-specific contaminants of concern. Surface and subsurface soil samples were collected at the site. Surface soil samples were collected from a depth of zero to two inches to assess direct human exposure. Subsurface soil samples were collected from a depth of two to 36 feet to assess soil contamination impacts to groundwater. The results indicate that soils at the site exceed the unrestricted SCG for VOCs, semi-volatile organic compounds (SVOCs), metals and PCBs. The primary soil contaminants are VOCs, SVOCs and PCBs associated with operation of the former waste oil recycling facility. Metals contamination in soil is most likely naturally occurring, with some probable contribution from historical urban fill activity. Therefore, metals are not considered site-specific contaminants of concern. Soil vapor samples were collected from the subsurface across the property to assess the potential for soil vapor intrusion. Trichloroethene (TCE) was found in a single soil vapor sample, which was located near the north property boundary within ten feet of a suspected area of historical solvent usage in the adjacent automotive repair facility. The presence of TCE across the site in soil and groundwater samples was rare. Post-Remediation Remediation at the site is complete. Prior to remediation, the primary contaminants of concern were VOCs, SVOCs and PCBs in soil; MEK, benzene, toluene and xylene (BTX), and PCBs in groundwater. Remedial actions have successfully achieved soil cleanup objectives for industrial use. Residual contamination including light non-aqueous phase liquid (LNAPL) with PCB concentrations in excess of 50 parts per million in the groundwater, is being managed under a Site Management Plan.

Health Problem: People are not drinking the contaminated groundwater because the area is served by a public water supply that is not affected by site-related contamination. Since the site is fenced and covered with gravel, people will not come into contact with site-related soil and groundwater contamination unless they dig below the ground surface. Volatile organic compounds in the groundwater may move into the soil vapor (air spaces within the soil), which in turn may move

QUANTA RESOURCES SITE USEPA REGION 2 (Continued) 1000321851

into overlying buildings and affect the indoor air quality. This process, which is similar to the movement of radon gas from the subsurface into the indoor air of buildings, is referred to as soil vapor intrusion. Because the site is vacant, the inhalation of site-related contaminants due to soil vapor intrusion does not represent a concern for the site in its current condition. However, the potential exists for the inhalation of site contaminants due to soil vapor intrusion for any future on-site redevelopment and occupancy. In addition, sampling indicates that soil vapor intrusion is not a concern for off-site buildings.

Event date: 09/08/1993
Event: CA Prioritization, Facility or area was assigned a high corrective action priority.

Event date: 02/10/1995
Event: CA Responsibility Referred To A Non-RCRA Federal Authority, Corrective Action at the facility or area referred to CERCLA.

Event date: 02/10/1995
Event: Stabilization Measures Evaluation, This facility is not amenable to stabilization activity at the present time, because it appears to be technically infeasible or inappropriate.

Event date: 05/09/1995
Event: RFA Completed

Event date: 05/09/1995
Event: RFA Determination Of Need For An RFI, RFI is Necessary;

Event date: 02/16/2011
Event: Date For Public Notice On Proposed Remedy

Event date: 03/21/2011
Event: Current Human Exposures under Control, Yes. Current Human Exposures Under Control has been verified. Based on a review of information contained in the EI determination, current human exposures are expected to be under control at the facility under current and reasonably expected conditions. This determination will be re-evaluated when the Agency/State becomes aware of significant changes at the facility.

Event date: 03/29/2011
Event: Date For Remedy Selection (CM Imposed)

Event date: 03/27/2013
Event: Igration of Contaminated Groundwater under Control, Yes, Migration of Contaminated Groundwater Under Control has been verified. Based on a review of information contained in the EI determination, it has been determined that migration of contaminated groundwater is under control at the facility. Specifically, this determination indicates that the migration of contaminated groundwater is under control, and that monitoring will be conducted to confirm that contaminated groundwater remains within the existing area of contaminated groundwater. This determination will be re-evaluated when the Agency becomes aware of significant changes at the facility.

Environmental Interest/Information System

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

CERCLIS (Comprehensive Environmental Response, Compensation, and Liability Information System) is the Superfund database that is used to support management in all phases of the Superfund program. The system contains information on all aspects of hazardous waste sites, including an inventory of sites, planned and actual site activities, and financial information.

ICIS (Integrated Compliance Information System) is the Integrated Compliance Information System and provides a database that, when complete, will contain integrated Enforcement and Compliance information across most of EPA's programs. The vision for ICIS is to replace EPA's independent databases that contain Enforcement data with a single repository for that information. Currently, ICIS contains all Federal Administrative and Judicial enforcement actions. This information is maintained in ICIS by EPA in the Regional offices and its Headquarters. A future release of ICIS will replace the Permit Compliance System (PCS) which supports the NPDES and will integrate that information with Federal actions already in the system. ICIS also has the capability to track other activities occurring in the Region that support Compliance and Enforcement programs. These include; Incident Tracking, Compliance Assistance, and Compliance Monitoring.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

To maintain currency of the following federal and state databases, EDR contacts the appropriate governmental agency on a monthly or quarterly basis, as required.

Number of Days to Update: Provides confirmation that EDR is reporting records that have been updated within 90 days from the date the government agency made the information available to the public.

STANDARD ENVIRONMENTAL RECORDS

Federal NPL site list

NPL: National Priority List
 National Priorities List (Superfund). The NPL is a subset of CERCLIS and identifies over 1,200 sites for priority cleanup under the Superfund Program. NPL sites may encompass relatively large areas. As such, EDR provides polygon coverage for over 1,000 NPL site boundaries produced by EPA's Environmental Photographic Interpretation Center (EPIC) and regional EPA offices.

Date of Government Version: 03/07/2016 Source: EPA
 Date Data Arrived at EDR: 04/05/2016 Telephone: N/A

Proposed NPL: Proposed National Priority List Sites

A site that has been proposed for listing on the National Priorities List through the issuance of a proposed rule in the Federal Register. EPA then accepts public comments on the site, responds to the comments, and places on the NPL those sites that continue to meet the requirements for listing.

 Data Release Frequency: Quarterly

NPL LIENS: Federal Superfund Liens

Federal Superfund Liens. Under the authority granted the USEPA by CERCLA of 1980, the USEPA has the authority to file liens against real property in order to recover remedial action expenditures or when the property owner received notification of potential liability. USEPA compiles a listing of filed notices of Superfund Liens.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

Federal Delisted NPL site list

Delisted NPL: National Priority List Deletions

The National Oil and Hazardous Substances Pollution Contingency Plan (NCP) establishes the criteria that the EPA uses to delete sites from the NPL. In accordance with 40 CFR 300.425 (e), sites may be deleted from the NPL where no further response is appropriate.

SEMS: Superfund Enterprise Management System

SEMS (Superfund Enterprise Management System) tracks hazardous waste sites, potentially hazardous waste sites, and remedial activities performed in support of EPA's Superfund Program across the United States. The list was formerly known as CERCLIS, renamed to SEMS by the EPA in 2015. The list contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies and private persons pursuant to Section 103 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). This dataset also contains sites which are either proposed to or on the National Priorities List (NPL) and the sites which are in the screening and assessment phase for possible inclusion on the NPL.

 Data Release Frequency: Quarterly

Federal CERCLIS NFRAP site list

SEMS-ARCHIVE: Superfund Enterprise Management System Archive

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

SEMS-ARCHIVE (Superfund Enterprise Management System Archive) tracks sites that have no further interest under the Federal Superfund Program based on available information. The list was formerly known as the CERCLIS-NFRAP, renamed to SEMS ARCHIVE by the EPA in 2015. EPA may perform a minimal level of assessment work at a site while it is archived if site conditions change and/or new information becomes available. Archived sites have been removed and archived from the inventory of SEMS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list the site on the National Priorities List (NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. The decision does not necessarily mean that there is no hazard associated with a site; it only means that, based upon available information, the location is not judged to be potential NPL site.

Federal RCRA non-CORRACTS TSD facilities list

RCRA-TSDF: RCRA - Treatment, Storage and Disposal
 RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Transporters are individuals or entities that move hazardous waste from the generator offsite to a facility that can recycle, treat, store, or dispose of the waste. TSDFs treat, store, or dispose of the waste.

Date of Government Version: 12/09/2015 Source: Environmental Protection Agency
 Date Data Arrived at EDR: 03/02/2016 Telephone: (212) 637-3660

Federal RCRA generators list

RCRA-LOG: RCRA - Large Quantity Generators
 RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Large quantity generators (LQGs) generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month.

State and tribal voluntary cleanup sites

VCP: Voluntary Cleanup Agreements
 New York established its Voluntary Cleanup Program (VCP) to address the environmental, legal and financial barriers that often hinder the redevelopment and reuse of contaminated properties. The Voluntary Cleanup Program was developed to enhance private sector cleanup of brownfields by enabling parties to remediate sites using private rather than public funds and to reduce the development pressures on "greenfield" sites.

ERP: Environmental Restoration Program Listing

In an effort to spur the cleanup and redevelopment of brownfields, New Yorkers approved a \$200 million Environmental Restoration or Brownfields Fund as part of the \$1.75 billion Clean Water/Clean Air Bond Act of 1996 (1996 Bond Act). Enhancements to the program were enacted on October 7, 2003. Under the Environmental Restoration Program, the State provides grants to municipalities to reimburse up to 90 percent of on-site eligible costs and 100% of off-site eligible costs for site investigation and remediation activities. Once remediated, the property may then be reused for commercial, industrial, residential or public use.

ADDITIONAL ENVIRONMENTAL RECORDS

Local Brownfield lists

US BROWNFIELDS: A Listing of Brownfields Sites

Brownfields are real property, the expansion, redevelopment, or reuse of which may be complicated by the presence or potential presence of a hazardous substance, pollutant, or contaminant. Cleaning up and reinvesting in these properties takes development pressures off of undeveloped, open land, and both improves and protects the environment. Assessment, Cleanup and Redevelopment Exchange System (ACRES) stores information reported by EPA Brownfields grant recipients on brownfields properties assessed or cleaned up with grant funding as well as information on Targeted Brownfields Assessments performed by EPA Regions. A listing of ACRES Brownfield sites is obtained from Cleanups in My Community. Cleanups in My Community provides information on Brownfields properties for which information is reported back to EPA, as well as areas served by Brownfields grant programs.

EPA WATCH LIST: EPA WATCH LIST

EPA maintains a "Watch List" to facilitate dialogue between EPA, state and local environmental agencies on enforcement matters relating to facilities with alleged violations identified as either significant or high priority. Being on the Watch List does not mean that the facility has actually violated the law only that an investigation by EPA or a state or local environmental agency has led those organizations to allege that an unproven violation has in fact occurred. Being on the Watch List does not represent a higher level of concern regarding the alleged violations that were detected, but instead indicates cases requiring additional dialogue between EPA, state and local agencies - primarily because of the length of time the alleged violation has gone unaddressed or unresolved.

2020 COR ACTION: 2020 Corrective Action Program List

The EPA has set ambitious goals for the RCRA Corrective Action program by creating the 2020 Corrective Action Universe. This RCRA cleanup baseline includes facilities expected to need corrective action. The 2020 universe contains a wide variety of sites. Some properties are heavily contaminated while others were contaminated but have since been cleaned up. Still others have not been fully investigated yet, and may require little or no remediation. Inclusion in the 2020 Universe does not necessarily imply failure on the part of a facility to meet its RCRA obligations.

RMP: Risk Management Plans

When Congress passed the Clean Air Act Amendments of 1990, it required EPA to publish regulations and guidance for chemical accident prevention at facilities using extremely hazardous substances. The Risk Management Program Rule (RMP Rule) was written to implement Section 112(r) of these amendments. The rule, which built upon existing industry codes and standards, requires companies of all sizes that use certain flammable and toxic substances to develop a Risk Management Program, which includes a(n): Hazard assessment that details the potential effects of an accidental release; an accident history of the last five years; and an evaluation of worst-case and alternative accidental releases; Prevention program that includes safety precautions and maintenance, monitoring, and employee training measures; and Emergency response program that spells out emergency health care, employee training measures and procedures for informing the public and response agencies (e.g. the fire department) should an accident occur.

RAATS: RCRA Administrative Action Tracking System

RCRA Administrative Action Tracking System. RAATS contains records based on enforcement actions issued under RCRA pertaining to major violators and includes administrative and civil actions brought by the EPA. For administrative actions after September 30, 1995, data entry in the RAATS database was discontinued. EPA will retain a copy of the database for historical records. It was necessary to terminate RAATS because a decrease in agency resources made it impossible to continue to update the information contained in the database.

HIST FTTS: FIFRA/TSCA Tracking System Administrative Case Listing

A complete administrative case listing from the FIFRA/TSCA Tracking System (FTTS) for all ten EPA regions. The information was obtained from the National Compliance Database (NCDB). NCDB supports the implementation of FIFRA (Federal Insecticide, Fungicide, and Rodenticide Act) and TSCA (Toxic Substances Control Act). Some EPA regions are now closing out records. Because of that, and the fact that some EPA regions are not providing EPA Headquarters with updated records, it was decided to create a HIST FTTS database. It included records that may not be included in the newer FTTS database updates. This database is no longer updated.

Date of Government Version: 10/19/2006

UMTRA: Uranium Mill Tailings Sites

Uranium ore was mined by private companies for federal government use in national defense programs. When the mills shut down, large piles of the sand-like material (mill tailings) remain after uranium has been extracted from the ore. Levels of human exposure to radioactive materials from the piles are low; however, in some cases tailings were used as construction materials before the potential health hazards of the tailings were recognized.

US AIRS (AFS): Aerometric Information Retrieval System Facility Subsystem (AFS)

The database is a sub-system of Aerometric Information Retrieval System (AIRS). AFS contains compliance data on air pollution point sources regulated by the U.S. EPA and/or state and local air regulatory agencies. This information comes from source reports by various stationary sources of air pollution, such as electric power plants, steel mills, factories, and universities, and provides information about the air pollutants they produce. Action, air program, air program pollutant, and general level plant data. It is used to track emissions and compliance data from industrial plants.

E DESIGNATION: E DESIGNATION SITE LISTING

The (E (Environmental)) designation would ensure that sampling and remediation take place on the subject properties, and would avoid any significant impacts related to hazardous materials at these locations. The (E) designations would require that the fee owner of the sites conduct a testing and sampling protocol, and remediation where appropriate, to the satisfaction of the NYCDEP before the issuance of a building permit by the Department of Buildings pursuant to the provisions of Section 11-15 of the Zoning Resolution (Environmental Requirements). The (E) designations also include a mandatory construction-related health and safety plan which must be approved by NYCDEP.

 Next Scheduled EDR Contact: 08/29/2016
 Data Release Frequency: Varies

HSWDS: Hazardous Substance Waste Disposal Site Inventory

The list includes any known or suspected hazardous substance waste disposal sites. Also included are sites delisted from the Registry of Inactive Hazardous Waste Disposal Sites and non-Registry sites that U.S. EPA Preliminary Assessment (PA) reports or Site Investigation (SI) reports were prepared. Hazardous Substance Waste Disposal Sites are eligible to be Superfund sites now that the New York State Superfund has been refinanced and changed. This means that the study inventory has served its purpose and will no longer be maintained as a separate entity. The last version of the study inventory is frozen in time. The sites on the study will not automatically be made Superfund sites, rather each site will be further evaluated for listing on the Registry. So overtime they will be added to the registry or not.

SPDES: State Pollutant Discharge Elimination System

New York State has a state program which has been approved by the United States Environmental Protection Agency for the control of wastewater and stormwater discharges in accordance with the Clean Water Act. Under New York State law the program is known as the State Pollutant Discharge Elimination System (SPDES) and is broader in scope than that required by the Clean Water Act in that it controls point source discharges to groundwaters as well as surface waters.

EDR HIGH RISK HISTORICAL RECORDS

EDR Exclusive Records

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

EDR MGP: EDR Proprietary Manufactured Gas Plants

The EDR Proprietary Manufactured Gas Plant Database includes records of coal gas plants (manufactured gas plants) compiled by EDR's researchers. Manufactured gas sites were used in the United States from the 1800's to 1950's to produce a gas that could be distributed and used as fuel. These plants used waste oil, rosin, coal, or a mixture of coal, oil, and water that also produced a significant amount of waste. Many of the byproducts of the gas production, such as coal tar (oil waste containing volatile and non-volatile chemicals), sludges, oils and other compounds are potentially hazardous to human health and the environment. The byproduct from this process was frequently disposed of directly at the plant site and can remain or spread slowly, serving as a continuous source of soil and groundwater contamination.

EDR Hist Auto: EDR Exclusive Historic Gas Stations

EDR has searched selected national collections of business directories and has collected listings of potential gas station/filling station/service station sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include gas station/filling station/service station establishments. The categories reviewed included, but were not limited to gas, gas station, gasoline station, filling station, auto, automobile repair, auto service station, service station, etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

OTHER DATABASE(S)

Depending on the geographic area covered by this report, the data provided in these specialty databases may or may not be complete. For example, the existence of wetlands information data in a specific report does not mean that all wetlands in the area covered by the report are included. Moreover, the absence of any reported wetlands information does not necessarily mean that wetlands do not exist in the area covered by the report.

CT MANIFEST: Hazardous Waste Manifest Data

Facility and manifest data. Manifest is a document that lists and tracks hazardous waste from the generator through transporters to a tsd facility.

Sensitive Receptors: There are individuals deemed sensitive receptors due to their fragile immune systems and special sensitivity to environmental discharges. These sensitive receptors typically include the elderly, the sick, and children. While the location of all sensitive receptors cannot be determined, EDR indicates those buildings and facilities - schools, daycares, hospitals, medical centers, and nursing homes - where individuals who are sensitive receptors are likely to be located.

AHA Hospitals:

Source: American Hospital Association, Inc.

SYRACUSE SCALE
156 SOLAR STREET
SYRACUSE, NY 13204

TARGET PROPERTY COORDINATES

Latitude (North): 43.058264 - 43° 3' 29.75"
Longitude (West): 76.158069 - 76° 9' 29.05"
Universal Transverse Mercator: Zone 18
UTM X (Meters): 405693.8
UTM Y (Meters): 4767720.5
Elevation: 378 ft. above sea level

USGS TOPOGRAPHIC MAP

Target Property Map: 5937769 SYRACUSE WEST, NY
Version Date: 2013

EDR's GeoCheck Physical Setting Source Addendum is provided to assist the environmental professional in forming an opinion about the impact of potential contaminant migration.

Assessment of the impact of contaminant migration generally has two principal investigative components:

1. Groundwater flow direction, and
2. Groundwater flow velocity.

Groundwater flow direction may be impacted by surface topography, hydrology, hydrogeology, characteristics of the soil, and nearby wells. Groundwater flow velocity is generally impacted by the nature of the geologic strata.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW DIRECTION INFORMATION

Groundwater flow direction for a particular site is best determined by a qualified environmental professional using site-specific well data. If such data is not reasonably ascertainable, it may be necessary to rely on other sources of information, such as surface topographic information, hydrologic information, hydrogeologic data collected on nearby properties, and regional groundwater flow information (from deep aquifers).

TOPOGRAPHIC INFORMATION

Surface topography may be indicative of the direction of surficial groundwater flow. This information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

TARGET PROPERTY TOPOGRAPHY

General Topographic Gradient: General West

SURROUNDING TOPOGRAPHY: ELEVATION PROFILES

Source: Topography has been determined from the USGS 7.5' Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

HYDROLOGIC INFORMATION

Surface water can act as a hydrologic barrier to groundwater flow. Such hydrologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Refer to the Physical Setting Source Map following this summary for hydrologic information (major waterways and bodies of water).

NATIONAL WETLAND INVENTORY

NWI Quad at Target Property: SYRACUSE WEST
Data Coverage: YES - refer to the Overview Map and Detail Map

HYDROGEOLOGIC INFORMATION

Hydrogeologic information obtained by installation of wells on a specific site can often be an indicator of groundwater flow direction in the immediate area. Such hydrogeologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Site-Specific Hydrogeological Data*:

Search Radius: 1.25 miles
Status: Not found

AQUIFLOW®

Search Radius: 1.000 Mile.

EDR has developed the AQUIFLOW Information System to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted by environmental professionals to regulatory authorities at select sites and has extracted the date of the report, groundwater flow direction as determined hydrogeologically, and the depth to water table.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW VELOCITY INFORMATION

Groundwater flow velocity information for a particular site is best determined by a qualified environmental professional using site specific geologic and soil strata data. If such data are not reasonably ascertainable, it may be necessary to rely on other sources of information, including geologic age identification, rock stratigraphic unit and soil characteristics data collected on nearby properties and regional soil information. In general, contaminant plumes move more quickly through sandy-gravelly types of soils than silty-clayey types of soils.

GEOLOGIC INFORMATION IN GENERAL AREA OF TARGET PROPERTY

Geologic information can be used by the environmental professional in forming an opinion about the relative speed at which contaminant migration may be occurring.

ROCK STRATIGRAPHIC UNIT

GEOLOGIC AGE IDENTIFICATION

Era: Paleozoic
System: Silurian
Series: Upper Silurian (Cayugan)
Code: S3 (decoded above as Era, System & Series)
Category: Stratified Sequence

Geologic Age and Rock Stratigraphic Unit Source: P.G. Schruben, R.E. Arndt and W.J. Bawiec, Geology of the Conterminous U.S. at 1:2,500,000 Scale - a digital representation of the 1974 P.B. King and H.M. Beikman Map, USGS Digital Data Series DDS - 11 (1994).

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

DOMINANT SOIL COMPOSITION IN GENERAL AREA OF TARGET PROPERTY

The U.S. Department of Agriculture's (USDA) Soil Conservation Service (SCS) leads the National Cooperative Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. The following information is based on Soil Conservation Service SSURGO data.

Soil Map ID: 1

Soil Component Name: Urban land
 Soil Surface Texture: Not reported
 Hydrologic Group: Not reported
 Soil Drainage Class: Unknown
 Corrosion Potential - Uncoated Steel: Not Reported
 Depth to Bedrock Min: > 0 inches
 Depth to Watertable Min: > 0 inches
 No Layer Information available.

Soil Map ID: 2

Soil Component Name: Urdortheints
 Soil Surface Texture: channery loam
 Hydrologic Group: Class A/D - Drained/undrained hydrology class of soils that can be drained and are classified.
 Soil Drainage Class: Somewhat excessively drained
 Hydric Status: Not hydric
 Corrosion Potential - Uncoated Steel: Moderate
 Depth to Bedrock Min: > 0 inches
 Depth to Watertable Min: > 137 inches

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

Soil Layer Information							
Layer	Boundary		Soil Texture Class	Classification		Saturated hydraulic conductivity micro m/sec	Soil Reaction (pH)
	Upper	Lower		AASHTO Group	Unified Soil		
1	0 inches	3 inches	channery loam	Silt-Clay Materials (more than 35 pct. passing No. 200), Silty Soils.	COARSE-GRAINED SOILS, Gravels, Gravels with fines, Clayey Gravel	Max: 141 Min: 0.42	Max: 7.3 Min: 4.5
2	3 inches	70 inches	very channery loam	Silt-Clay Materials (more than 35 pct. passing No. 200), Silty Soils.	FINE-GRAINED SOILS, Silts and Clays (liquid limit less than 50%), Lean Clay	Max: 42 Min: 0.42	Max: 8.4 Min: 4.5

Soil Map ID: 3

Soil Component Name: Water
 Soil Surface Texture: channery loam
 Hydrologic Group: Class A/D - Drained/undrained hydrology class of soils that can be drained and are classified.
 Soil Drainage Class: Unknown
 Corrosion Potential - Uncoated Steel: Not Reported
 Depth to Bedrock Min: > 0 inches
 Depth to Watertable Min: > 0 inches
 No Layer Information available.

LOCAL / REGIONAL WATER AGENCY RECORDS

EDR Local/Regional Water Agency records provide water well information to assist the environmental professional in assessing sources that may impact ground water flow direction, and in forming an opinion about the impact of contaminant migration on nearby drinking water wells.

PHYSICAL SETTING SOURCE RECORDS SEARCHED

TOPOGRAPHIC INFORMATION

USGS 7.5' Digital Elevation Model (DEM)
Source: United States Geologic Survey
EDR acquired the USGS 7.5' Digital Elevation Model in 2002 and updated it in 2006. The 7.5 minute DEM corresponds to the USGS 1:24,000- and 1:25,000-scale topographic quadrangle maps. The DEM provides elevation data with consistent elevation units and projection.

Current USGS 7.5 Minute Topographic Map
Source: U.S. Geological Survey

HYDROLOGIC INFORMATION

Flood Zone Data: This data, available in select counties across the country, was obtained by EDR in 2003 & 2011 from the Federal Emergency Management Agency (FEMA). Data depicts 100-year and 500-year flood zones as defined by FEMA.

NWI: National Wetlands Inventory. This data, available in select counties across the country, was obtained by EDR in 2002, 2005 and 2010 from the U.S. Fish and Wildlife Service.

State Wetlands Data: Freshwater Wetlands
Source: Department of Environmental Conservation
Telephone: 518-402-8961

HYDROGEOLOGIC INFORMATION

AQUIFLOW[®] Information System

Source: EDR proprietary database of groundwater flow information
EDR has developed the AQUIFLOW Information System (AIS) to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted to regulatory authorities at select sites and has extracted the date of the report, hydrogeologically determined groundwater flow direction and depth to water table information.

GEOLOGIC INFORMATION

Geologic Age and Rock Stratigraphic Unit

Source: P.G. Schruben, R.E. Arndt and W.J. Bawiec, Geology of the Conterminous U.S. at 1:2,500,000 Scale - A digital representation of the 1974 P.B. King and H.M. Beikman Map, USGS Digital Data Series DDS - 11 (1994).

STATSGO - State Soil Geographic Database

Source: Department of Agriculture, Natural Resources Conservation Service (NRCS)
The U.S. Department of Agriculture's (USDA) Natural Resources Conservation Service (NRCS) leads the national Conservation Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. Soil maps for STATSGO are compiled by generalizing more detailed (SSURGO) soil survey maps.

SSURGO: Soil Survey Geographic Database

Source: Department of Agriculture, Natural Resources Conservation Service (NRCS)
Telephone: 800-672-5559

SSURGO is the most detailed level of mapping done by the Natural Resources Conservation Service, mapping scales generally range from 1:12,000 to 1:63,360. Field mapping methods using national standards are used to construct the soil maps in the Soil Survey Geographic (SSURGO) database. SSURGO digitizing duplicates the original soil survey maps. This level of mapping is designed for use by landowners, townships and county natural resource planning and management.

PHYSICAL SETTING SOURCE RECORDS SEARCHED

LOCAL / REGIONAL WATER AGENCY RECORDS

FEDERAL WATER WELLS

PWS: Public Water Systems
Source: EPA/Office of Drinking Water

Telephone: 202-564-3750

Public Water System data from the Federal Reporting Data System. A PWS is any water system which provides water to at least 25 people for at least 60 days annually. PWSs provide water from wells, rivers and other sources.

PWS ENF: Public Water Systems Violation and Enforcement Data

Source: EPA/Office of Drinking Water

Telephone: 202-564-3750

Violation and Enforcement data for Public Water Systems from the Safe Drinking Water Information System (SDWIS) after August 1995. Prior to August 1995, the data came from the Federal Reporting Data System (FRDS).

USGS Water Wells: USGS National Water Inventory System (NWIS)

This database contains descriptive information on sites where the USGS collects or has collected data on surface water and/or groundwater. The groundwater data includes information on wells, springs, and other sources of groundwater.

EXECUTIVE SUMMARY

DESCRIPTION

Environmental Data Resources, Inc.'s (EDR) City Directory Report is a screening tool designed to assist environmental professionals in evaluating potential liability on a target property resulting from past activities. EDR's City Directory Report includes a search of available city directory data at 5 year intervals.

RESEARCH SUMMARY

The following research sources were consulted in the preparation of this report. A check mark indicates where information was identified in the source and provided in this report.

Site Name:

Syracuse Scale
156 Solar Street
Syracuse, NY 13204
EDR Inquiry # 4679337.3

Client Name:

Plumley Engineering
8232 Loop Rd
Baldwinsville, NY 13027
Contact: Jesse Plumley

The Sanborn Library has been searched by EDR and maps covering the target property location as provided by Plumley Engineering were identified for the years listed below. The Sanborn Library is the largest, most complete collection of fire insurance maps. The collection includes maps from Sanborn, Bromley, Perris & Browne, Hopkins, Barlow, and others. Only Environmental Data Resources Inc. (EDR) is authorized to grant rights for commercial reproduction of maps by the Sanborn Library LLC, the copyright holder for the collection. Results can be authenticated by visiting www.edrnet.com/sanborn.

The Sanborn Library is continually enhanced with newly identified map archives. This report accesses all maps in the collection as of the day this report was generated.

Certified Sanborn Results:

Sanborn® Library search results

Certification #: 8D28-4183-8D23

The Sanborn Library includes more than 1.2 million fire insurance maps from Sanborn, Bromley, Perris & Browne, Hopkins, Barlow and others which track historical property usage in approximately 12,000 American cities and towns. Collections searched:

- Library of Congress
- University Publications of America
- EDR Private Collection

The Sanborn Library LLC Since 1866™

Limited Permission To Make Copies

Plumley Engineering (the client) is permitted to make up to FIVE photocopies of this Sanborn Map transmittal and each fire insurance map accompanying this report solely for the limited use of its customer. No one other than the client is authorized to make copies. Upon request made directly to an EDR Account Executive, the client may be permitted to make a limited number of additional photocopies. This permission is conditioned upon compliance by the client, its customer and their agents with EDR's copyright policy; a copy of which is available upon request.

EDR Topographic Map Library has been searched by EDR and maps covering the target property location as provided by Plumley Engineering were identified for the years listed below. EDR's Historical Topo Map Report is designed to assist professionals in evaluating potential liability on a target property resulting from past activities. EDR's Historical Topo Map Report includes a search of a collection of public and private color historical topographic maps, dating back to the late 1800s.

Environmental Data Resources, Inc. (EDR) Aerial Photo Decade Package is a screening tool designed to assist environmental professionals in evaluating potential liability on a target property resulting from past activities. EDR's professional researchers provide digitally reproduced historical aerial photographs, and when available, provide one photo per decade.

APPENDIX A - BORING LOGS

APPENDIX B - LABORATORY REPORTS

1.0 INTRODUCTION

Plumley Engineering, P.C. completed a Phase I Environmental Site Assessment (ESA) on the commercial parcel located at 156-158 Solar Street in the City of Syracuse, Onondaga County, New York in September 2016. The Phase I ESA identified various recognized environmental conditions (RECs) and other environmental concerns on the Property, and recommended further investigation. Refer to *Figure 1 – Subsurface Investigation Plan* for the site layout.

1.1 PURPOSE

The purpose of this Phase II ESA was to assess the potential presence of environmental contamination related to current and past uses of the Property identified in the Phase I ESA. The following RECs were revealed:

- Contaminated soil was discovered during the removal of a former onsite gasoline underground storage tank (UST). Although contaminated soil was excavated from the site, the spill incident associated with this tank removal was closed as not meeting cleanup standards. The spill area should be further investigated to determine the amount of contamination remaining and the potential for completing the cleanup.
- This Property has been utilized for industrial purposes for over 100 years. Although the general nature of the known occupants suggests a low risk for environmental releases, environmental and occupant records prior to the 1970's are fragmented. The Property should be investigated for evidence of past releases, particularly if any portions of the building are to be demolished.

1.2 SPECIAL TERMS AND CONDITIONS

The Phase II ESA included completing soil borings and installing temporary wells to evaluate subsurface soils and groundwater. Selected soil and groundwater samples were analyzed for suspected site contaminants. The Phase II ESA was completed in general

conformance with American Society for Testing and Materials (ASTM) Standard E 1903-11, *Standard Guide for Environmental Site Assessments: Phase II Environmental Site Assessment Process*.

Services performed by Plumley Engineering in preparation of this report were conducted in a manner consistent with the level of care and skill ordinarily exercised by members of the engineering profession practicing contemporaneously under similar conditions in the locality of the project. Under no circumstances is any warranty, expressed or implied, made in connection with providing these services.

1.3 LIMITATIONS AND EXCEPTIONS OF ASSESSMENT

A Phase I ESA was completed prior to proceeding with the Phase II ESA. The scope of the Phase II ESA was based on available information concerning the Property.

1.4 LIMITING CONDITIONS AND METHODOLOGY USED

The Phase II ESA evaluated subsurface soils and shallow groundwater for potential impacts of common compounds typically associated with petroleum and industrial operations from samples collected from selected locations. This assessment cannot rule out contaminants not included in the analytical program, or localized soil or groundwater impacts.

2.0 BACKGROUND

2.1 SITE DESCRIPTION AND FEATURES

The Property is owned by Syracuse Scale Company, Inc. and consists of one parcel, with tax identification number 118.-06-01.0. The Property is approximately 2.0 acres in size and is currently used for commercial purposes. There is one commercial building located on the Property. Refer to *Figure 1 – Subsurface Investigation Plan* for additional information.

2.2 PHYSICAL SETTING

The elevation of the Property is approximately 375 feet (USGS datum) above sea level. The nearest body of water is Onondaga Creek, located approximately 1,000 feet to the west.

2.3 SITE HISTORY AND LAND USE

The Property has been used for industrial purposes.

2.4 ADJACENT PROPERTY LAND USE

Review of records, historical topographic maps and aerials indicates adjacent properties have been utilized for industrial, commercial and residential purposes.

2.5 SUMMARY OF PREVIOUS ASSESSMENTS

There is no information indicating any prior subsurface assessments have been completed on the Property. A subsurface investigation report for the adjacent property to the south was obtained while planning the Phase II. This investigation¹ identified several volatile organic compounds (VOCs) in subsurface soil samples. The report suggested the impacts were from an offsite source. The results were reported to the New York State Department of Environmental Conservation (DEC) and Spill No. 9707031 was assigned. The DEC closed this spill on May 4, 2004 without requiring further investigation or remediation.

3.0 PHASE II ACTIVITIES

3.1 SCOPE OF WORK

The scope of work for this Phase II ESA included completion of soil borings and installation of temporary monitoring wells to evaluate subsurface soils and groundwater. Seven soil

¹Limited Subsurface Investigation, Borden Research Center, Franklin Square, by Environmental Products & Services, Inc., January 22, 1998.

borings were completed on October 27, 2016. Temporary wells were installed in all seven borings.

Soil samples were obtained from each of the borings at various depths on the date the borings were completed. Groundwater samples were obtained from each temporary well on November 1, 2016. Selected soil and groundwater samples were submitted to the laboratory for analytical analysis.

3.1.1 Conceptual Site Model and Sampling Plan

The potential site contaminants encountered were those generally associated with industrial site use, and included volatile organic compounds (VOCs) and semi-volatile organic compounds (SVOCs). VOCs are generally soluble in water, and therefore mobile in the environment. SVOCs tend to be less mobile. In general, VOCs tend to be found in soils near potential sources and migrate away from source areas in groundwater. SVOCs tend to be found in soils near potential sources and do not migrate as readily in the groundwater. This Phase II ESA assessed both VOC and SVOC impact to soil and groundwater. Additional testing for metals and polychlorinated biphenyls (PCBs) was also completed on surficial soil samples.

The soil borings for subsurface soil and groundwater sampling were located across the Property and in downgradient locations. Boring B-4 was located in the area suspected to be the site of the former gasoline UST and dispenser. The sample point locations are shown on *Figure 1 – Subsurface Investigation Plan*.

3.1.2 Chemical Testing Plan

Selected surface soil, subsurface soil and groundwater samples were analyzed for VOCs, SVOCs, metals and PCBs.

3.2 FIELD EXPLORATIONS AND METHODS

3.2.1 Soil Borings

Parratt-Wolff, Inc., accompanied by a geologist from Plumley Engineering, completed boring operations using a truck mounted Geoprobe rig. Soil borings were completed to a depth of 20 to 24 feet below ground surface (bgs.)

Soil samples were collected continuously from the ground surface to the bottom of each boring using a 4-foot macro-core. All samples were inspected and logged for soil lithology and field indicators of potential contamination (odors, staining, sheen). Representative samples were containerized in the field and screened with a photoionization detection (PID) meter.

Refer to *Appendix A – Boring Logs* for additional information.

3.2.2 Monitoring Well Installations

One-inch diameter well casings were installed in all seven soil boring locations. Ground-water elevation measurements were taken after water levels stabilized in the wells.

3.3 SAMPLING AND CHEMICAL ANALYSES AND METHODS

3.3.1 Soil

Field indicators of apparent contamination (odors, staining, elevated PID readings) were present in some of the subsurface soil samples collected from the borings. The samples from boring B-4 exhibited a petroleum-like odor with trace staining and had low level PID meter readings ranging from 3 to 8 parts per million (ppm). The samples from borings B-5 and B-6

had petroleum-like odors and sheens at the water table and PID meter readings ranging from 48 to 986 ppm. The samples from borings B-1, B-2, B-3 and B-7 had organic odors from the layer of peat encountered at a depth of approximately 6 to 7 feet bgs across the site and no positive PID meter readings. Refer to *Table 1 – Summary of Soil Data* for additional information.

Soil samples with the highest indicators of apparent contamination and soil samples collected from various depths in the soil borings that did not exhibit positive PID meter readings were selected for laboratory testing. The samples were submitted to SGS Accutest for analysis for VOCs per EPA Method 8260 (CP-51² or Full List) and SVOCs per EPA Method 8270 (CP-51 or Base/Neutral Compounds). Other select soil samples were submitted for analysis for metals (8 RCRA) and PCBs. The results were compared to CP-51 Recommended Soil Cleanup Levels (SCLs) and Commercial Use Soil Cleanup Objectives (SCOs).³

3.3.2 Groundwater

Groundwater samples were collected from the seven temporary wells (B-1/TW through B-7/TW) using standard sampling methods. All seven well samples were submitted for analysis of VOCs per EPA Method 8260 (CP-51 or Full List). Groundwater samples from B-3/TW, B-5/TW and B-6/TW were also submitted for SVOCs per EPA Method 8270 (CP-51 or Base/Neutral Compounds) and metals (8 RCRA). Samples were filtered in the field using a 0.45 Micron High-Capacity dispos-a-filter™ prior to collecting the metals. The results were compared to State groundwater standards.⁴

²DEC Commissioner Policy, *CP-51 / Soil Cleanup Guidance*, issued October 21, 2010.

³New York Codes, Rules and Regulations, Title 6 (6NYCRR), Part 375-6 *Remedial Program Soil Cleanup Objectives*.

⁴DEC Technical and Operational Guidance Series (TOGS) 1.1.1, *Ambient Water Quality Standards and Guidance Values and Groundwater Effluent Limits*, dated June 1998 and Addenda.

4.0 EVALUATION AND PRESENTATION OF RESULTS

4.1 SUBSURFACE CONDITIONS

4.1.1 Geologic Setting

The soil profile encountered can generally be described as follows:

0 to 8 feet bgs.....Gray moist fine to medium gravel and little to fine sand (fill).

8 to 12 feet bgs.....Brown moist silt, clay and peat.

12 to 20+ feet bgs.....Gray wet fine to coarse gravel and silt, with fine to coarse sand.

Layers of black sand with slag appeared at various depths from 0 to approximately 6 feet bgs.

4.1.2 Hydrogeologic Conditions

The water table was generally encountered at a depth of 5.6 to 11.10 feet bgs. The overall groundwater flow direction, as calculated from water elevations recorded on November 1, 2016, is from east to west across the Property. Refer to *Table 2 – Monitoring Well and Groundwater Elevation Data* for additional information. Groundwater elevation contours are shown on *Figure 1 – Subsurface Investigation Plan*.

4.2 ANALYTICAL DATA

4.2.1 Soil

A few individual VOCs were detected in the soil samples from borings B-3, B-4, B-5 and B-6. All VOCs detected were well below the CP-51 SCLs and Commercial Use SCOs with the exception of two compounds in the sample from boring B-5. Ethylbenzene was reported at 1.01 milligrams per kilogram (mg/kg), marginally exceeding the CP-51 SCL of 1 mg/kg,

and 1,2,4-Trimethylbenzene was reported at 7.46 mg/kg, exceeding the CP-51 SCL of 3.6 mg/kg. Both compounds were below the Commercial Use SCOs of 390 and 190 mg/kg, respectively.

Several SVOCs were detected in the samples collected from B-1, B-4, B-5, B-6 and B-7. All SVOCs detected were below the CP-51 SCLs and Commercial Use SCOs with the exception of one compound in the soil sample from B-7 (0 to 2 feet bgs). Chrysene was detected at a concentration of 1.12 mg/kg, slightly above the CP-51 SCL of 1 mg/kg but much lower than the Commercial Use SCO of 56 mg/kg.

Several metals were detected in the soil samples from borings B-1, B-3, B-5, B-6 and B-7. All detected metals were well below the Commercial Use SCOs with the exception of Barium in the sample from boring B-3, with a reported concentration of 461 mg/kg, exceeding the Commercial Use SCO of 400 mg/kg.

PCBs were not detected in any of the five soil samples analyzed.

Refer to *Table 3 – Summary of Soil Analytical Results* and *Appendix B – Laboratory Reports* for additional information.

4.2.2 Groundwater

Petroleum-like odors and sheens were present in the water purged from borings B-5 and B-6 and a slight sheen was noted in the water sample from B-6. No field indicators of contamination were observed in the other groundwater samples collected.

VOCs were either non-detected or below standards in the groundwater samples from wells B-1/TW, B-2/TW, B-3/TW, B-4/TW and B-7/TW. Several VOCs were detected in the groundwater sample from well B-5/TW at concentrations exceeding State standards.

No SVOCs were detected in the water samples collected from wells B-3/TW and B-6/TW. Four SVOCs were detected in the sample from well B-5/TW. Acenaphthene, bis(2-Chloroethyl)ether, 2-Methylnaphthalene and Naphthalene were reported at concentrations

of 2.1, 5.1, 4.5 and 65.8 micrograms per liter ($\mu\text{g/L}$), respectively. The State groundwater standards for bis(2-Chloroethyl)ether and Naphthalene are 1 and 10 $\mu\text{g/L}$, respectively. There is no State groundwater standard for Acenaphthene or 2-Methylnaphthalene, so a guideline concentration of 50 $\mu\text{g/L}$ is used.

Barium was reported at concentrations of 110, 381 and 167 $\mu\text{g/L}$ in the filtered water samples from B-3/TW, B-5/TW and B-6/TW, respectively. These reported concentrations were well below the State groundwater standard of 1,000 $\mu\text{g/L}$. Lead was also detected in B-5/TW and B-6/TW at concentrations of 129 and 5.3 $\mu\text{g/L}$, respectively. The State groundwater standard for lead is 25 $\mu\text{g/L}$.

Refer to *Table 4 – Summary of Groundwater Analytical Results* and *Appendix B – Laboratory Reports* for additional information.

5.0 DISCUSSION OF FINDINGS AND CONCLUSIONS

5.1. SOIL IMPACTS

There is a layer of peat at approximately 8 feet bgs and the site has been filled with various soil materials from the peat layer to the ground surface. No significant soil impacts were identified in the fill (0 to 8 feet bgs) with the exception of Chrysene reported above the CP-51 SCL but below the Restricted Use SCO in B-7 and Barium reported above the Restricted Use SCO in B-3.

Low levels of petroleum-like odors and low PID meter readings were observed in boring B-4 at the suspected location of the former gasoline UST. Chemical testing showed a few VOCs present, but at concentrations below the CP-51 SCLs.

Stronger petroleum-like odors and elevated PID meter readings were observed in deeper soils (12 to 16 feet bgs) in the gravel unit in the area of borings B-5 and B-6. Low level

VOCs and SVOCs were detected in the samples from these borings. Chemical testing showed concentrations were below the CP-51 SCLs, with the exception of two VOCs in B-5. All compounds were well below Commercial Use SCOs.

5.2. GROUNDWATER IMPACTS

Groundwater analytical results indicated elevated levels of several VOCs, including benzene, toluene, ethylbenzene and xylene (BTEX), as well as naphthalene, were present at concentrations exceeding State groundwater standards in the sample from boring B-5/TW. Lead also exceeded State groundwater standards in the sample from B-5/TW. None of the other groundwater samples were impacted.

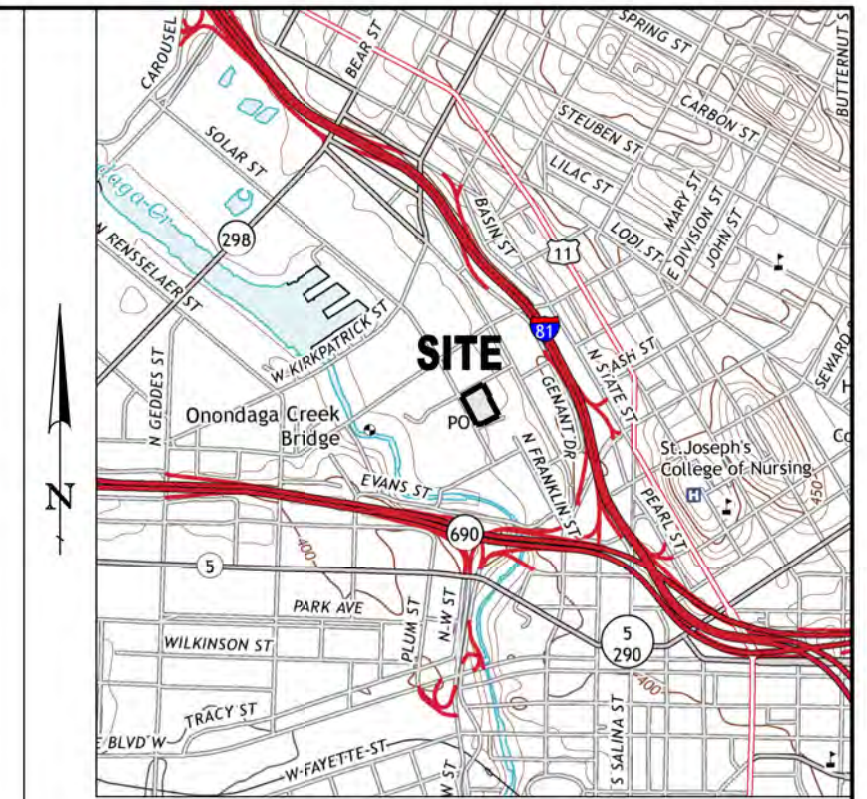

5.3. RECOGNIZED ENVIRONMENTAL CONDITIONS

The previously identified RECs were associated with the former onsite UST and industrial operations. The findings from the investigation of the former UST area (boring B-4) do not indicate any significant residual impacts. The findings in borings B-5 and B-6 are not consistent with the location of the former UST or other known onsite sources. However, the findings are similar to those of the 1998 subsurface investigation on the adjacent former Borden property associated with Spill No. 9707031. This spill was closed by the DEC without further investigation or remediation, suggesting the impacts in B-5 and B-6 are from an offsite source. The only known potential source is a former manufactured gas plant gas holder tank located upgradient of the Property and the adjacent former Borden property. Gas holders are known sources of BTEX and naphthalene.

6.0 RECOMMENDATIONS

Based on the findings, no further investigation is recommended and no remediation appears to be warranted. We recommend a copy of this report be submitted to the DEC for their review and concurrence.

LABORATORY REPORTS

Technical Report for

Plumley Engineering, P.C.

Solar Street, 156-158 Solar Street, Syracuse, NY

2016122.001

SGS Accutest Job Number: MC48547

Sampling Date: 10/27/16

Report to:

Plumley Engineering, P.C.
8232 Loop Road
Baldwinsville, NY 13027
dhudson@plumleyeng.com

ATTN: Derk Hudson

Total number of pages in report: **39**

Test results contained within this data package meet the requirements of the National Environmental Laboratory Accreditation Program and/or state specific certification programs as applicable.

H. (Brad) Madadian
Lab Director

Client Service contact: Robert Soll 508-481-6200

Certifications: MA (M-MA136, SW846 NELAC) CT (PH-0109) NH (250210) RI (00071) FL (E87579) NY (11791) NJ (MA926) PA (6801121) ND (R-188) CO (MA00136) MN (11546AA) NC (653) IL (002337) WI (399080220) DoD ELAP (L-A-B L2235)

This report shall not be reproduced, except in its entirety, without the written approval of SGS Accutest.
Test results relate only to samples analyzed.

**RE: Limited Hazardous Material Pre-Renovation Survey Report
 Syracuse Scale Building - 156-158 Solar Street, Syracuse, New York 13204
 AECC Project Number: 17-257**

Dear Mr. deForest:

The Asbestos & Environmental Consulting Corporation (AECC) conducted a limited hazardous material pre-renovation survey of the Syracuse Scale building, located at 156-158 Solar Street, in Syracuse, New York. The following sections summarize the results:

ASBESTOS PRE-RENOVATION SURVEY

The asbestos bulk samples were collected by Mr. Nicholas Coulombe, Mr. Bryan Airel, and Mr. Randy Arnold, New York State Department of Labor (NYSDOL)-certified Asbestos Building Inspectors. The following building materials were collected, labeled, and shipped to AmeriSci New York for laboratory analysis:

Table 1: Asbestos Bulk Sampling Summary

SAMPLE NUMBER	MATERIAL DESCRIPTION	SAMPLE LOCATION	ASBESTOS CONTENT
TRANS-001A,B	Transite Paneling (Gray)	3 rd Floor, Rooms 302 & 303 - Under Window and Part of Shelving System	20.0% Chrysotile
WGLZ-002A,B	Window Glazing Compound (White/Gray)	3 rd Floor, Rooms 302 & 303	1.6% Chrysotile

Black Roof Flashings (FLSH-106)	Workshop Roof	3,600 SF	NF, NA
Electrical Components (PACM)	Throughout Building – Inside Electrical Boxes	500 SF	NF, NA
Elevator Components (PACM)	Elevator Shaft and/or Elevator Penthouse	20 SF	NF, NA
Internal Boiler Components (PACM)	Inside Boiler	60 SF	NF, NA
Vermiculite Insulation & Associated Debris (PACM)	2 nd Floor, Room 206 Above Ceiling and on Floor	260 SF	NF, Damaged

Table Notes:

SF = Square Feet

LF = Linear Feet

F = Friable

NF = Non-Friable

NA = Not Assessed, Due to Safety Issues and/or Snow Covered the Material

Asbestos Bulk Sampling Summary – By regulatory definition, a building material must be greater than one percent (1%) asbestos to be considered an ACM. During this survey, two (2) types of gray transite panels, three (3) types of window glazing compound (white/gray, gray, and dark gray), two (2) types of joint compound (tan and off-white), tan metal wall tile mastic, 9”x9” tan floor tile with associated black mastic, white pipe insulation, 12”x12” white floor tile, gray air-cell pipe insulation, tan ceramic wall tile mastic, 9”x9” green floor tile with associated black mastic / black tar paper, tan cove base mastic, four (4) types of gray window caulk, two (2) types of door caulk (tan/gray and gray), black rolled roofing with silver aluminum coat, two (2)

Mr. Jonathan H. deForest
BBL Construction Services, LLC
Limited Hazardous Material Pre-Renovation Survey Report
Syracuse Scale Building - 156-158 Solar Street, Syracuse, New York 13204

types of gray/black roof cement, four (4) types of black roof flashings, black built-up roofing materials, and black roof cement were determined to be ACMs by laboratory analysis. Additionally, pipe fitting insulation, loose-fill vermiculite insulation (and associated debris), internal boiler components, elevator components, and electrical components were designated as PACMs by AECC's field personnel. According to state and federal laws, ACMs and PACMs must be handled and disposed of by a licensed abatement contractor prior to any renovation or demolition-related activities. The laboratory analysis results have been included in Attachment B of this report.

NYSDOL Compliance – Due to the presence of disturbed ACM / PACM identified during this survey, an asbestos contamination assessment must be completed by a NYSDOL-certified Asbestos Building Inspector / Air Monitoring Technician. Once the contamination assessment has been completed, a NYSDOL-certified Asbestos Project Designer must author and submit a site-specific variance petition (since the areas of disturbed material are greater than 10 square feet in size) to the NYSDOL Engineering Services Unit to facilitate the cleanup of the affected areas. Until which time the abatement work is performed, affected areas should be properly labeled and appropriate signage should be installed to prevent anyone from accessing these asbestos-contaminated areas of the building.

OSHA Compliance – It should be noted that the Occupational Safety & Health Administration (OSHA) Asbestos Standard (29 CFR 1926.1101) has a definition for both "asbestos" and "asbestos-containing material." Under OSHA Asbestos Standard, the definition of asbestos covers all materials containing any concentration of detected asbestos, including those with concentrations less than or equal to one percent asbestos (i.e. the cream colored window glazing compound collected in Room 303, the pink wood flooring vapor barrier collected on the 2nd floor, the tan wall panel mastic collected in Bathroom 203, the brown cove base mastic collected from Janitor's Closet 202, the gray window glazing compound collected from the backroom window on the 1st floor, the light gray window glazing compound collected from the annex windows, the black rolled roofing collected from the 2nd floor roof, and roofing tar collected from the 3rd floor roof sampled during this survey). Although work operations conducted in areas where a material contains less than or equal to one percent asbestos is an "unclassified" operation, the employer still must follow the requirements of 29 CFR 1926.1101(g)(1) [except (g)(1)(i)], (g)(2) and (g)(3) that describe engineering and work practice controls operations to prevent unnecessary asbestos exposures to their employees (i.e. worker protection regulations).

Transmittal of Building / Structure Asbestos Survey Information – As required by New York State Industrial Code Rule 56, copies of this report shall be immediately transmitted by the building / structure owner (prior to any renovation-related activities), as follows:

- (1) One (1) copy of the completed asbestos survey shall be sent by the owner or their agent to the local entity charged with issuing a permit for such demolition, renovation, remodeling or repair work under State or local laws.
- (2) One (1) copy of completed asbestos survey shall be kept on the construction site with the asbestos notification and variance, if required, throughout the duration of the asbestos project and any associated demolition, renovation, remodeling or repair project.

LEAD-BASED PAINT INSPECTION

The following representative paint applications were sampled, labeled, and shipped to Schneider Laboratories Global, Inc. for lead analysis:

Table 3: Lead Paint Chip Sampling Summary

SAMPLE NUMBER	MATERIAL DESCRIPTION	SAMPLE LOCATION	LEAD CONTENT*
PAINT-001	White Colored Paint	3 rd Floor, Room 303 – From Brick Wall	0.0500%
PAINT-002	Gray Colored Paint	3 rd Floor, Room 303 – From Wood Wall	0.0300%
PAINT-003	Yellow Colored Paint	3 rd Floor, Room 303 – From Wall Paneling	0.302%
PAINT-004	Green Colored Paint	3 rd Floor, Room 303 – From Wall Paneling	0.0256%
PAINT-005	White Colored Paint	3 rd Floor, Room 303 – From Wooden Shelf	<0.00764%
PAINT-006	Yellow Colored Paint	3rd Floor, Room 303 – From Wall Paneling	8.65%
PAINT-007	White Colored Paint	3 rd Floor, Room 302 – From Steel Beam	0.119%
PAINT-008	Red Colored Paint	3rd Floor, Room 301 – From Wall	1.13%
PAINT-009	White Colored Paint	3 rd Floor, Room 301 – From Steel Beam	0.0339%
PAINT-010	Light Blue Colored Paint	2 nd Floor, Open Section 200 – From Brick Wall (East)	0.271%
PAINT-011	Dark Gray Colored Paint	2 nd Floor, Open Section 200 – From Brick Wall (East)	0.0542%
PAINT-012	Yellow Colored Paint	2 nd Floor, Open Section 200 – From Brick Wall (East)	0.0574%
PAINT-013	Light Gray Colored Paint	2 nd Floor, Open Section 200 (East) – From Brick Wall	0.0554%
PAINT-014	White Colored Paint	2 nd Floor, Open Section 200 – East Stairwell Wood Wall	0.0380%
PAINT-015	White Colored Paint	2 nd Floor, Open Section 200 – East Stairwell Wood Ceiling	0.0443%
PAINT-016	Light Gray Colored Paint	2nd Floor, Open Section 200 - East Stairwell Wood Wall	1.49%
PAINT-017	White/Silver Colored Paint	2 nd Floor, Open Section 200 – From Steel Beam (Center)	0.205%
PAINT-018	Yellow/Red Colored Paint	2nd Floor, Open Section 200 – (West) From Metal Railing	10.9%
PAINT-019	Green Colored Paint	2 nd Floor, Open Section 200 – (West) – Wooden Chair	0.104%
PAINT-020	Gray Colored Paint	2 nd Floor, Open Section 200 – (West) From Wood Floor	0.0940%
PAINT-021	Light Green Colored Paint	2 nd Floor, Room 212 – From Wall	0.497%

 BBL Construction Services, LLC
Limited Hazardous Material Pre-Renovation Survey Report
Syracuse Scale Building - 156-158 Solar Street, Syracuse, New York 13204

Table 3: Lead Paint Chip Sampling Summary

SAMPLE NUMBER	MATERIAL DESCRIPTION	SAMPLE LOCATION	LEAD CONTENT*
PAINT-022	White/Green Colored Paint	2nd Floor, Bathroom 203 – From Door	3.88%
PAINT-023	Lt. Green/Gray Colored Paint	2 nd Floor, Janitor's Closet 202 – From Wall	0.483%
PAINT-024	Dark Green Colored Paint	2nd Floor, Stairwell Landing – From Concrete Floor	3.63%
PAINT-025	Dark Green Colored Paint	2nd Floor, Room 212 – From Metal Radiator	1.02%
PAINT-026	Silver Colored Paint	2 nd Floor, Bathroom 201 – From Metal Radiator	0.390%
PAINT-027	White/Gray Colored Paint	2nd Floor, Bathroom 201 – From Metal Stall Door	1.04%
PAINT-028	Gray Colored Paint	2nd Floor, Section 200 – From Metal Elevator Door	12.9%
PAINT-029	White Colored Paint	1 st Floor, Open Section 100 (East) – From Steel Beam	0.479%
PAINT-030	White Colored Paint	1st Floor, Open Section 100 (East) – From Brick Wall	0.526%
PAINT-031	Yellow Colored Paint	1st Floor, Bathroom 101 – From Brick Wall	0.877%
PAINT-032	Gray Colored Paint	1 st Floor, Open Section 100 (West) – From Concrete Floor	0.118%
PAINT-033	Green Colored Paint	1st Floor, Room 106 – From Metal Wall	8.25%
PAINT-034	Green Colored Paint	1 st Floor, Boiler Room 108 – From Concrete Block Wall	0.00867%
PAINT-035	Yellow Colored Paint	1st Floor, Corridor, By Boiler Room – From Brick Wall	0.773%
PAINT-036	Blue Colored Paint	1 st Floor, Annex – From Concrete Wall	0.104%
PAINT-037	Yellow Colored Paint	1st Floor, Center Corridor – From Brick Wall	1.28%
PAINT-038	Cream Colored Paint	1 st Floor, Back Room – From Brick Wall	0.0522%
PAINT-039	Green Colored Paint	1st Floor, Garage – From Metal Door	7.45%
PAINT-040	Yellow Colored Paint	1 st Floor, Office Closet - From Concrete Wall	0.0236%
PAINT-041	White Colored Paint	Exterior, Back Room Door – From Wood Door Trim	1.75%
PAINT-042	Red Colored Paint	Exterior, Office Section – From Brick Wall	0.125%
PAINT-043	Red Colored Paint	Exterior, Annex – From Metal Wall	6.65%
PAINT-044	Gray Colored Paint	Exterior, 3rd Floor – From Wood Siding	1.07%

Table Notes:

* = Percentage of Lead by Weight

Lead Paint Chip Sampling Summary – By regulatory definition, LBP is defined as any paint containing a minimum of 0.5% lead by weight. Twenty (20) paint applications (PAINT-003, PAINT-006, PAINT-008, PAINT-010, PAINT-016, PAINT-018, PAINT-022, PAINT-024, PAINT-025, PAINT-027, PAINT-028, PAINT-030, PAINT-031, PAINT-033, PAINT-035, PAINT-037, PAINT-039, PAINT-041, PAINT-043, and PAINT-044) sampled during this survey were determined to be LBP by laboratory analysis. Additionally, it should be noted that all of the other paint applications, except the white colored paint (PAINT-005) on the 3rd floor shelving, are lead-containing materials (even though they are not considered LBP). By regulatory definition, a LCM contains any detectable amount of lead, even concentrations less than 0.5%. As such, certain worker protection regulations (OSHA) and waste disposal regulations (NYSDEC) shall apply during the handling and disposal of the LBPs and LCMs identified at the project site. The laboratory analysis report for the paint chip sampling has been included in Attachment C.

CAULK SAMPLING FOR PCBs

AECC collected representative building caulk applications from the building and shipped them to Schneider Laboratories Global, Inc. for polychlorinated biphenyls (PCB) analysis. The following table summarizes the results:

Table 4: PCB Bulk Sampling Summary

SAMPLE NUMBER	MATERIAL DESCRIPTION	SAMPLE LOCATION	PCB CONTENT
CLK-083P	Window Caulk (Gray)	Exterior Workshop Window	BRL
CLK-084P	Expansion Joint Caulk (Gray)	Exterior Expansion Joint Between Workshop & Garage	BRL
CLK-085P	Door Caulk (Tan/Gray)	Exterior Entry Door to Offices	BRL
CLK-086P	Window Caulk (Gray)	Exterior Office Window	BRL
CLK-087P	Door Caulk (Gray)	Exterior Door to Backroom	3.5 ppm
WCLK-108P	Window Caulk (Gray)	Exterior Workshop Window	0.614 ppm
WCLK-109P	Window Caulk (Gray)	Exterior Factory Window	BRL

Table Notes:

BRL = Below Reporting Limit
 ppm = Parts Per Million

PCB Bulk Sampling Summary – By regulatory definition, a PCB-containing bulk material is defined as any building material containing at least 50 parts per million (ppm) of PCBs. The bulk samples collected during this pre-renovation survey are not PCB-containing bulk materials, as determined by laboratory analysis. However, it should be noted that due to the presence of PCBs (even though the concentrations are less than 50 ppm) in two (2) caulk applications (CLK-087 and WCLK-108), certain handling (OSHA) and disposal requirements (as only certain municipal landfills will accept PCBs at concentrations less than 50 ppm) will apply to these building materials. The PCB laboratory results have been included in Attachment D.

MISCELLANEOUS HAZARDOUS / SPECIAL WASTE INVENTORY

The following items were observed during AECC's survey and presumed to contain the specified hazardous / special wastes in the following table:

Table 5: Miscellaneous Hazardous / Special Waste Inventory

MISCELLANEOUS ITEM	ITEM LOCATION	ESTIMATED COUNT	PRESUMED HAZ MATERIAL	ITEM CONDITION
Fluorescent Light Bulbs	Throughout Building	450	Mercury	Intact
Light Ballasts	Throughout Building	200	PCBs	Intact
Exit Signs (Fluorescent Bulbs & Lead Batteries)	Lobby, Garage & Room 209	3	Mercury, Lead	Intact
Interior Emergency Flood Light Batteries	1 st Floor, Factory Area	2	Lead	Intact
In-Service Thermostats	1 st & 2 nd Floor Factory Areas, Workshop & Room 209	21	Mercury	Intact
Stored Lead Batteries	Workshop	8	Lead	Intact
Elevator Oils	Elevator Penthouse	NQ	Petroleum Compounds, PCBs	Intact
Transformers	1 st Floor, Factory Area	2	PCBs	Intact
Air Conditioning Unit	2 nd Floor, Room 204	1	Freon	Intact
Solvents, Paints	1 st Floor Factory Area, Garage, Work Shop, Backroom, Lobby, & Office Areas	70	VOCs, Lead	Intact
Pesticides, Insecticides, Herbicides and Chemical Fertilizers	1 st Floor Factory Area, Garage, Work Shop, Backroom, Lobby, & Office Areas	10	Pesticides Herbicides	Intact
Automotive Liquids	Garage & Work Shop	140	Petroleum Compounds VOCs	Intact
Oil, Gas, Kerosene Containers	Garage & Work Shop	20	Petroleum Compounds	Intact
Propane (LP), Fuel Oil	Room 110	NQ	Petroleum Compounds	Intact
Electronic Scrap Items	1 st Floor Factory Area, Work Shop	100	Metals	Damaged
Fuel Spill	Boiler Room & Storage Room	500 SF	Petroleum Compounds	Damaged

Table Notes:

NQ = Not Quantified, Due to Inaccessibility

Mr. Jonathan H. deForest
BBL Construction Services, LLC
Limited Hazardous Material Pre-Renovation Survey Report
Syracuse Scale Building - 156-158 Solar Street, Syracuse, New York 13204

Miscellaneous Hazardous / Special Wastes Summary – Additional investigation into the status of these materials may be performed to prove that hazardous materials are not present. However; without conducting this additional investigation, these materials must be presumed to contain potentially hazardous materials and handled / disposed of in accordance with all applicable state, federal, and local regulations.

Report Note – In the event that other building materials (materials not specifically identified in this report) are identified during the course of renovation activities, the materials shall be presumed to be hazardous (for asbestos, lead, PCBs, etc.) until examined by an appropriately certified individual and laboratory analysis proves otherwise.

If you have any questions pertaining to this report, please do not hesitate to contact AECC's corporate office at (315) 432-9400.

Sincerely,
Asbestos & Environmental Consulting Corporation

Bryan Bowers

Duly Authorized Representative – Bryan Bowers:

This license has been issued in accordance with applicable provisions of Article 30 of the Labor Law of New York State and of the New York State Codes, Rules and Regulations (12 NYCRR Part 56). It is subject to suspension or revocation for a (1) serious violation of state, federal or local laws with regard to the conduct of an asbestos project, or (2) demonstrated lack of responsibility in the conduct of any job involving asbestos or asbestos material.

This license is valid only for the contractor named above and this license or a photocopy must be prominently displayed at the asbestos project worksite. This license verifies that all persons employed by the licensee on an asbestos project in New York State have been issued an Asbestos Certificate, appropriate for the type of work they perform, by the New York State Department of Labor.

Eileen M. Franko, Director
For the Commissioner of Labor

Reporting Notes:

(1) Sample prepared for analysis by ELAP 198.6 method

Analyzed by: Bo Sun Bo Sun

*NAD/NSD =no asbestos detected; NA =not analyzed; NA/PS=not analyzed/positive stop, (SOF-V) = Sprayed On Fireproofing containing Vermiculite; (SM-V) = Surfacing Material containing Vermiculite; PLM Bulk Asbestos Analysis by EPA 600/M4-82-020 per 40 CFR 763 (NVLAP 200546-0), ELAP PLM Method 198.1 for NY friable samples, which includes the identification and quantitation of vermiculite or 198.6 for NOB samples or EPA 400 pt ct by EPA 600/M4-82-020 (NY ELAP Lab 11480); Note:PLM is not consistently reliable in detecting asbestos in floor coverings and similar non-friable organically bound materials. NAD or Trace results by PLM are inconclusive, TEM is currently the only method that can be used to determine if this material can be considered or treated as non asbestos-containing in NY State (also see EPA Advisory for floor tile, FR 59,146,38970,8/1/94) National Institute of Standards and Technology Accreditation requirements mandate that this report must not be reproduced except in full without the approval of the lab.This PLM report relates ONLY to the items tested. **Quantitative Analysis (Semi/Full); Bulk Asbestos Analysis - PLM by EPA 600/M4-82-020 per 40 CFR or ELAP 198.1 for New York friable samples or ELAP 198.6 for New York NOB samples; TEM (Semi/Full) by EPA 600/R-93/116 (not covered by NVLAP Bulk accreditation) or ELAP 198.4; for New York samples; NAD = no asbestos detected during a quantitative analysis; NA = not analyzed; Trace = <1%; (SOF-V) = Sprayed On Fireproofing containing Vermiculite; (SM-V) = Surfacing Material containing Vermiculite; Quantitation for beginning weights of <0.1 grams should be considered as qualitative only; Qualitative Analysis: Asbestos analysis results of "Present" or "NVA = No Visible Asbestos" represents results for Qualitative PLM or TEM Analysis only (no accreditation coverage available from any regulatory agency for qualitative analyses); NVLAP (PLM) 200546-0, NYSDOH ELAP Lab 11480, AIHA-LAP, LLC (PLM) Lab ID 102843.

Warning Note: PLM limitation, only TEM will resolve fibers <0.25 micrometers in diameter. TEM bulk analysis is representative of the fine grained matrix material and may not be representative of non-uniformly dispersed debris for which PLM evaluation is recommended (i.e. soils and other heterogenous materials).

- Analyzing Sequence:
- 1 - Separate layers/mastics for individual analysis, if applicable.
 - 2 - Determine method of analysis for PLM (198.1 or 198.6).
 - 3 - If the PLM NOB result is equal to or greater than 1% asbestos, testing of material is complete.
If the PLM NOB result is less than 1% asbestos, please analyze utilizing TEM.
 - 4 - If submitted in series (A, B, C), please stop at first positive.
 - 5 - Report results as % Asbestos via e-mail.

**Quantitative Analysis (Semi/Full); Bulk Asbestos Analysis - PLM by EPA 600/M4-82-020 per 40 CFR or ELAP 198.1 for New York friable samples or ELAP 198.6 for New York NOB samples; TEM (Semi/Full) by EPA 600/R-93/116 (not covered by NVLAP Bulk accreditation) or ELAP 198.4; for New York samples; NAD = no asbestos detected during a quantitative analysis; NA = not analyzed; Trace = <1%; (SOF-V) = Sprayed On Fireproofing containing Vermiculite; (SM-V) = Surfacing Material containing Vermiculite; Quantitation for beginning weights of <0.1 grams should be considered as qualitative only; Qualitative Analysis: Asbestos analysis results of "Present" or "NVA = No Visible Asbestos" represents results for Qualitative PLM or TEM Analysis only (no accreditation coverage available from any regulatory agency for qualitative analyses): NVLAP (PLM) 200546-0, NYSDOH ELAP Lab 11480, AIHA-LAP, LLC (PLM) Lab ID 102843.

Warning Note: PLM limitation, only TEM will resolve fibers <0.25 micrometers in diameter. TEM bulk analysis is representative of the fine grained matrix material and may not be representative of non-uniformly dispersed debris for which PLM evaluation is recommended (i.e. soils and other heterogenous materials).

- Analyzing Sequence:
- 1 - Separate layers/mastics for individual analysis, if applicable.
 - 2 - Determine method of analysis for PLM (198.1 or 198.6).
 - 3 - If the PLM NOB result is equal to or greater than 1% asbestos, testing of material is complete. If the PLM NOB result is less than 1% asbestos, please analyze utilizing TEM.
 - 4 - If submitted in series (A, B, C), please stop at first positive.
 - 5 - Report results as % Asbestos via e-mail.

*NAD/NSD =no asbestos detected; NA =not analyzed; NA/PS=not analyzed/positive stop, (SOF-V) = Sprayed On Fireproofing containing Vermiculite; (SM-V) = Surfacing Material containing Vermiculite; PLM Bulk Asbestos Analysis by EPA 600/M4-82-020 per 40 CFR 763 (NVLAP 200546-0), ELAP PLM Method 198.1 for NY friable samples, which includes the identification and quantitation of vermiculite or 198.6 for NOB samples or EPA 400 pt ct by EPA 600/M4-82-020 (NY ELAP Lab 11480); Note:PLM is not consistently reliable in detecting asbestos in floor coverings and similar non-friable organically bound materials. NAD or Trace results by PLM are inconclusive, TEM is currently the only method that can be used to determine if this material can be considered or treated as non asbestos-containing in NY State (also see EPA Advisory for floor tile, FR 59,146,38970,8/1/94) National Institute of Standards and Technology Accreditation requirements mandate that this report must not be reproduced except in full without the approval of the lab.This PLM report relates ONLY to the items tested. AIHA-LAP, LLC Lab ID 102843, RI Cert AAL-094, CT Cert PH-0186, Mass Cert AA000054.

- Analyzing Sequence:
- 1 - Separate layers/mastics for individual analysis, if applicable.
 - 2 - Determine method of analysis for PLM (198.1 or 198.6).
 - 3 - If the PLM NOB result is equal to or greater than 1% asbestos, testing of material is complete. If the PLM NOB result is less than 1% asbestos, please analyze utilizing TEM.
 - 4 - If submitted in series (A, B, C), please stop at first positive.
 - 5 - Report results as % Asbestos via e-mail.

PLM Bulk Asbestos Report

17-257; BBL Construction Services, LLC; Syracuse Scale
Building - 156-158 Solar Street, Syracuse, New York

Reporting Notes:

Analyzed by: John P. Koubiadis 

*NAD/NSD =no asbestos detected; NA =not analyzed; NA/PS=~~not analyzed~~/positive stop, (SOF-V) = Sprayed On Fireproofing containing Vermiculite; (SM-V) = Surfacing Material containing Vermiculite; PLM.Bulk Asbestos Analysis by EPA 600/M4-82-020 per 40 CFR 763 (NVLAP 200546-0), ELAP PLM Method 198.1 for NY friable samples, which includes the identification and quantitation of vermiculite or 198.6 for NOB samples or EPA 400 pt ct by EPA 600/M4-82-020 (NY ELAP Lab 11480); Note:PLM is not consistently reliable in detecting asbestos in floor coverings and similar non-friable organically bound materials. NAD or Trace results by PLM are inconclusive, TEM is currently the only method that can be used to determine if this material can be considered or treated as non asbestos-containing in NY State (also see EPA Advisory for floor tile, FR 59,146,38970,8/1/94) National Institute of Standards and Technology Accreditation requirements mandate that this report must not be reproduced except in full without the approval of the lab.This PLM report relates ONLY to the items tested. AIHA-LAP, LLC Lab ID 102843, RI Cert AAL-094, CT Cert PH-0186, Mass Cert AA000054.

Analyzed by: Marik Peysakhov ; Date Analyzed 1/15/2018

**Quantitative Analysis (Semi/Full); Bulk Asbestos Analysis - PLM by EPA 600/M4-82-020 per 40 CFR or ELAP 198.1 for New York friable samples or ELAP 198.6 for New York NOB samples; TEM (Semi/Full) by EPA 600/R-93/116 (not covered by NVLAP Bulk accreditation) or ELAP 198.4; for New York samples; NAD = no asbestos detected during a quantitative analysis; NA = not analyzed; Trace = <1%; (SOF-V) = Sprayed On Fireproofing containing Vermiculite; (SM-V) = Surfacing Material containing Vermiculite; Quantitation for beginning weights of <0.1 grams should be considered as qualitative only; Qualitative Analysis: Asbestos analysis results of "Present" or "NVA = No Visible Asbestos" represents results for Qualitative PLM or TEM Analysis only (no accreditation coverage available from any regulatory agency for qualitative analyses); NVLAP (PLM) 200546-0, NYSDOH ELAP Lab 11480, AIHA-LAP, LLC (PLM) Lab ID 102843.

Warning Note: PLM limitation, only TEM will resolve fibers <0.25 micrometers in diameter. TEM bulk analysis is representative of the fine grained matrix material and may not be representative of non-uniformly dispersed debris for which PLM evaluation is recommended (i.e. soils and other heterogenous materials).

- Analyzing Sequence:
- 1 - Separate layers/mastics for individual analysis, if applicable.
 - 2 - Determine method of analysis for PLM (198.1 or 198.6).
 - 3 - If the PLM NOB result is equal to or greater than 1% asbestos, testing of material is complete. If the PLM NOB result is less than 1% asbestos, please analyze utilizing TEM.
 - 4 - If submitted in series (A, B, C), please stop at first positive.
 - 5 - Report results as % Asbestos via e-mail.

Reporting Notes:

Analyzed by: John P. Koubiadis 

*NAD/NSD =no asbestos detected; NA =not analyzed; NA/PS=not analyzed/positive stop, (SOF-V) = Sprayed On Fireproofing containing Vermiculite; (SM-V) = Surfacing Material containing Vermiculite; PLM Bulk Asbestos Analysis by EPA 600/M4-82-020 per 40 CFR 763 (NVLAP 200546-0), ELAP PLM Method 198.1 for NY friable samples, which includes the identification and quantitation of vermiculite or 198.6 for NOB samples or EPA 400 pt ct by EPA 600/M4-82-020 (NY ELAP Lab 11480); Note:PLM is not consistently reliable in detecting asbestos in floor coverings and similar non-friable organically bound materials. NAD or Trace results by PLM are inconclusive, TEM is currently the only method that can be used to determine if this material can be considered or treated as non asbestos-containing in NY State (also see EPA Advisory for floor tile, FR 59,146,38970,8/1/94) National Institute of Standards and Technology Accreditation requirements mandate that this report must not be reproduced except in full without the approval of the lab.This PLM report relates ONLY to the items tested. Table I
Summary of Bulk Asbestos Analysis Results

17-257; BBL Construction Services, LLC; Syracuse Scale Building - 156-158 Solar Street, Syracuse, New York

AmeriSci Sample #	Client Sample#	HG Area	Sample Weight (gram)	Heat Sensitive Organic %	Acid Soluble Inorganic %	Insoluble Non-Asbestos Inorganic %	** Asbestos % by PLM/DS	** Asbestos % by TEM
-------------------	----------------	---------	----------------------	--------------------------	--------------------------	------------------------------------	-------------------------	----------------------

Analyzed by: Marik Peysakhov ; Date Analyzed 1/15/2018

**Quantitative Analysis (Semi/Full); Bulk Asbestos Analysis - PLM by EPA 600/M4-82-020 per 40 CFR or ELAP 198.1 for New York friable samples or ELAP 198.6 for New York NOB samples; TEM (Semi/Full) by EPA 600/R-93/116 (not covered by NVLAP Bulk accreditation) or ELAP 198.4; for New York samples; NAD = no asbestos detected during a quantitative analysis; NA = not analyzed; Trace = <1%; (SOF-V) = Sprayed On Fireproofing containing Vermiculite; (SM-V) = Surfacing Material containing Vermiculite; Quantitation for beginning weights of <0.1 grams should be considered as qualitative only; Qualitative Analysis: Asbestos analysis results of "Present" or "NVA = No Visible Asbestos" represents results for Qualitative PLM or TEM Analysis only (no accreditation coverage available from any regulatory agency for qualitative analyses); NVLAP (PLM) 200546-0, NYSDOH ELAP Lab 11480, AIHA-LAP, LLC (PLM) Lab ID 102843.

Warning Note: PLM limitation, only TEM will resolve fibers <0.25 micrometers in diameter. TEM bulk analysis is representative of the fine grained matrix material and may not be representative of non-uniformly dispersed debris for which PLM evaluation is recommended (i.e. soils and other heterogenous materials).

- Analyzing Sequence:
- 1 - Separate layers/mastics for individual analysis, if applicable.
 - 2 - Determine method of analysis for PLM (198.1 or 198.6).
 - 3 - If the PLM NOB result is equal to or greater than 1% asbestos, testing of material is complete. If the PLM NOB result is less than 1% asbestos, please analyze utilizing TEM.
 - 4 - If submitted in series (A, B, C), please stop at first positive.
 - 5 - Report results as % Asbestos via e-mail.

Reporting Notes:

(1) Sample prepared for analysis by ELAP 198.6 method

Analyzed by: John P. Koubiadis

*NAD/NSD =no asbestos detected; NA =not analyzed; NA/PS=not analyzed/positive stop, (SOF-V) = Sprayed On Fireproofing containing Vermiculite; (SM-V) = Surfacing Material containing Vermiculite; PLM Bulk Asbestos Analysis by EPA 600/M4-82-020 per 40 CFR 763 (NVLAP 200546-0), ELAP PLM Method 198.1 for NY friable samples, which includes the identification and quantitation of vermiculite or 198.6 for NOB samples or EPA 400 pt ct by EPA 600/M4-82-020 (NY ELAP Lab 11480); Note:PLM is not consistently reliable in detecting asbestos in floor coverings and similar non-friable organically bound materials. NAD or Trace results by PLM are inconclusive, TEM is currently the only method that can be used to determine if this material can be considered or treated as non asbestos-containing in NY State (also see EPA Advisory for floor tile, FR 59,146,38970,8/1/94) National Institute of Standards and Technology Accreditation requirements mandate that this report must not be reproduced except in full without the approval of the lab. This PLM report relates ONLY to the items tested. AIHA-LAP, LLC Lab ID 102843, RI Cert AAL-094, CT Cert PH-0186, Mass Cert AA000054.

Analyzed by: Marik Peysakhov ; Date Analyzed 1/15/2018

**Quantitative Analysis (Semi/Full); Bulk Asbestos Analysis - PLM by EPA 600/M4-82-020 per 40 CFR or ELAP 198.1 for New York friable samples or ELAP 198.6 for New York NOB samples; TEM (Semi/Full) by EPA 600/R-93/116 (not covered by NVLAP Bulk accreditation) or ELAP 198.4; for New York samples; NAD = no asbestos detected during a quantitative analysis; NA = not analyzed; Trace = <1%; (SOF-V) = Sprayed On Fireproofing containing Vermiculite; (SM-V) = Surfacing Material containing Vermiculite; Quantitation for beginning weights of <0.1 grams should be considered as qualitative only; Qualitative Analysis: Asbestos analysis results of "Present" or "NVA = No Visible Asbestos" represents results for Qualitative PLM or TEM Analysis only (no accreditation coverage available from any regulatory agency for qualitative analyses); NVLAP (PLM) 200546-0, NYSDOH ELAP Lab 11480, AIHA-LAP, LLC (PLM) Lab ID 102843.

Warning Note: PLM limitation, only TEM will resolve fibers <0.25 micrometers in diameter. TEM bulk analysis is representative of the fine grained matrix material and may not be representative of non-uniformly dispersed debris for which PLM evaluation is recommended (i.e. soils and other heterogenous materials).

- Analyzing Sequence:
- 1 - Separate layers/mastics for individual analysis, if applicable.
 - 2 - Determine method of analysis for PLM (198.1 or 198.6).
 - 3 - If the PLM NOB result is equal to or greater than 1% asbestos, testing of material is complete. If the PLM NOB result is less than 1% asbestos, please analyze utilizing TEM.
 - 4 - If submitted in series (A, B, C), please stop at first positive.
 - 5 - Report results as % Asbestos via e-mail.

Reporting Notes:

(1) Sample prepared for analysis by ELAP 198.6 method

Analyzed by: Karol H. Lu 

*NAD/NSD =no asbestos detected; NA =not analyzed; NA/PS=not analyzed/positive stop, (SOF-V) = Sprayed On Fireproofing containing Vermiculite; (SM-V) = Surfacing Material containing Vermiculite; PLM Bulk Asbestos Analysis by EPA 600/M4-82-020 per 40 CFR 763 (NVLAP 200546-0), ELAP PLM Method 198.1 for NY friable samples, which includes the identification and quantitation of vermiculite or 198.6 for NOB samples or EPA 400 pt ct by EPA 600/M4-82-020 (NY ELAP Lab 11480); Note:PLM is not consistently reliable in detecting asbestos in floor coverings and similar non-friable organically bound materials. NAD or Trace results by PLM are inconclusive, TEM is currently the only method that can be used to determine if this material can be considered or treated as non asbestos-containing in NY State (also see EPA Advisory for floor tile, FR 59,146,38970,8/1/94) National Institute of Standards and Technology Accreditation requirements mandate that this report must not be reproduced except in full without the approval of the lab.This PLM report relates ONLY to the items tested. AIHA-LAP, LLC Lab ID 102843, RI Cert AAL-094, CT Cert PH-0186, Mass Cert AA000054.

Analyzed by: Marik Peysakhov ; Date Analyzed 1/15/2018

**Quantitative Analysis (Semi/Full); Bulk Asbestos Analysis - PLM by EPA 600/M4-82-020 per 40 CFR or ELAP 198.1 for New York friable samples or ELAP 198.6 for New York NOB samples; TEM (Semi/Full) by EPA 600/R-93/116 (not covered by NVLAP Bulk accreditation) or ELAP 198.4; for New York samples; NAD = no asbestos detected during a quantitative analysis; NA = not analyzed; Trace = <1%; (SOF-V) = Sprayed On Fireproofing containing Vermiculite; (SM-V) = Surfacing Material containing Vermiculite; Quantitation for beginning weights of <0.1 grams should be considered as qualitative only; Qualitative Analysis: Asbestos analysis results of "Present" or "NVA = No Visible Asbestos" represents results for Qualitative PLM or TEM Analysis only (no accreditation coverage available from any regulatory agency for qualitative analyses); NVLAP (PLM) 200546-0, NYSDOH ELAP Lab 11480, AIHA-LAP, LLC (PLM) Lab ID 102843.

Warning Note: PLM limitation, only TEM will resolve fibers <0.25 micrometers in diameter. TEM bulk analysis is representative of the fine grained matrix material and may not be representative of non-uniformly dispersed debris for which PLM evaluation is recommended (i.e. soils and other heterogenous materials).

- Analyzing Sequence:
- 1 - Separate layers/mastics for individual analysis, if applicable.
 - 2 - Determine method of analysis for PLM (198.1 or 198.6).
 - 3 - If the PLM NOB result is equal to or greater than 1% asbestos, testing of material is complete.
If the PLM NOB result is less than 1% asbestos, please analyze utilizing TEM.
 - 4 - If submitted in series (A, B, C), please stop at first positive.
 - 5 - Report results as % Asbestos via e-mail.

Federal Lead Paint Statute

Location	Clearance	Unit
Lead in paint by weight	< 0.50	%
Lead in paint as PPM	< 5000	mg/kg

Minimum reporting limit: 10.0 µg. Concentration and *Reporting Limit (RL) based on weights provided by client. All internal QC parameters were met. Unusual sample conditions, if any, are described. Values are reported to three significant figures. PPM = mg/kg | PPB = µg/kg. The test results reported relate only to the samples submitted. AIHA-LAP, LLC accredited for Lead.

UST – Underground Storage Tank
VOC – Volatile Organic Compound

PHASE II ENVIRONMENTAL SITE ASSESSMENT
Syracuse Scale, 156-158 Solar Street, Syracuse, New York

1.0 INTRODUCTION

The Asbestos & Environmental Consulting Corporation (AECC) performed a limited Phase II Environmental Site Assessment (ESA) at the Syracuse Scale Co. Inc. facility (hereafter referred to as "Syracuse Scale"), located at 156-158 Solar Street, in the City of Syracuse, New York (hereafter referenced as the "Site", "Property", or "Facility"). The parcel is displayed on Figure 1 (Site Plan/Sample Location). AECC performed this work under contract to BBL Construction Services, LLC (hereafter referred to as "BBL"), the construction manager for the prospective purchaser of the Property, who intends to construct ground level commercial office space with apartments on the upper floors. The north wing of the subject building is currently in use as offices and operations by Syracuse Scale, while the remainder of the building is vacant.

This Phase II ESA follows an earlier (December 2016) Phase II Assessment performed by Plumley Engineering, P.C. (Plumley) for the Owner of the property which, based upon the data developed as part of that Phase II ESA, determined that "no further investigation is recommended and no remediation appears to be warranted." The property is zoned for commercial use and is serviced by both municipal water and sewer.

1.1 PURPOSE

The purpose of this investigation was to further determine the nature and extent of contaminated soil and groundwater at the Site, and to recommend whether additional investigation or remedial action is warranted.

1.2 PROJECT HISTORY

AECC was provided with the following reports pertaining to the Site prior to initiating investigation activities:

- Phase I Environmental Site Assessment (ESA), September 2016, Plumley Engineering, P.C. (Plumley): The Phase I ESA identified two (2) Recognized Environmental Conditions (RECs), including: 1) a history of industrial use for over 100 years, and 2) records of contaminated soil associated with the removal of an underground gasoline tank that was located in the southern parking lot adjacent to Solar Street (off site for the source of this current Phase II ESA).
- Phase II ESA, December 2016, Plumley: Seven (7) borings were advanced during the Phase II ESA. Temporary wells were installed in each boring. Soil and groundwater samples were collected from each boring / well. In general, concentrations of contaminants were found to be below applicable State standards, except for a boring/well (B-5/TW) and boring B-6, both located in the eastern portion of the southern parking lot (in front of the "southern annex building"). Petroleum odors, staining, and sheens were observed in the three (3) borings advanced in the southern parking lot. NYSDEC Spill File #16-09292 was assigned to the Site. Groundwater was determined to flow from east to west. Spill #16-09292 was closed by the Department of Environmental Conservation ("DEC") on January 9, 2017. The DEC determined that "Based on the review of the analytical data and comparing it to the unrestricted Use Values found in Commissioner's Policy, CP-51, no further remedial activities are necessary."

In addition, AECC was retained by BBL to execute a Phase I ESA for the Facility concurrent with the Limited Phase II ESA activities. AECC's Phase I ESA, provided under separate cover and dated January 24, 2018, identified the following Recognized Environmental Conditions (RECs), Historical RECs, or Controlled RECs associated with the Site:

PHASE II ENVIRONMENTAL SITE ASSESSMENT
Syracuse Scale, 156-158 Solar Street, Syracuse, New York

- *Oil Slick / Staining in Boiler Room and Adjacent Storage Area*

During site reconnaissance activities, accumulated oil on the floor in the boiler room and adjacent storage room was observed. Between October 2017 (initial site visit) and January 2018 (follow-up site visit), building owner representatives hired a company to remove the oil and clean the area. However, oil slicks and staining still remain at some locations. Although the associated AST appears to have been cleaned, the status of registration and other tank closure activities is unknown.

- *Historical Industrial / Manufacturing use (On-site and Vicinity)*

The Site and the immediately surrounding area have a 60+ year history of industrial and manufacturing use. This history increases the likelihood of the use of various chemicals and petroleum compounds that could impact Site soil and groundwater.

- *Chemical Jars*

During site reconnaissance activities, AECC noted the presence of several chemicals in jars (both intact and broken) on the third floor / mezzanine areas. The chemicals appeared to be dyes and/or associated with dyeing operations.

- *'Urban Land' / Fill*

The presence of 'urban land' indicates the potential use of poor-quality fill to bring the site to current grade. In addition, small, discrete soil piles were noted on the Site. The origin of said piles are unknown, and the potential that they have been illegally dumped and/or are contaminated exists.

- *Historical 2,000-gallon UST Removal and Encountered Contamination*

NYSDEC records indicate that a 2,000-gallon UST (used for storing gasoline) was removed from the Site in 1995. Spill file 95-11787 was opened when contamination related to the former UST was encountered during removal activities at the Site. Although the spill file was closed, the lack of further documented information (no formal tank closure report, sampling results, contaminated soil/groundwater disposal report, or figure depicting the former tank location) causes this incident to be considered a CREC.

- *On-Site Soil and Groundwater Contamination (2016)*

Plumley Engineering, P.C. completed soil boring activities and temporary well installations at the Site in December 2016. Detectable concentrations of several contaminants were noted and laboratory analysis of collected samples exhibited concentrations of contaminants above their respective CP-51 Soil Cleanup Objectives (SCOs) at some locations. Although the NYSDEC closed the associated Spill File (# 1609292), the remaining contamination constitutes a CREC.

The Phase I ESA recommended that additional investigative activities be initiated at the Site, which this Phase II ESA investigation addresses.

2.0 SCOPE OF SERVICES

The following activities were conducted at the Site during this Phase II ESA.

2.1 UTILITY CLEARANCES & GPR Survey

Prior to initiating soil borings, AECC's drilling subcontractor, NYEG Drilling, LLC (NYEG), contacted Dig Safely New York to identify buried public utilities at the site boundaries.

In addition, AECC subcontracted National Ground Penetrating Radar Services (NGPR) to further delineate buried utilities on the site in the vicinity of proposed soil boring locations. NGPR utilized ground-penetrating radar and other geophysical equipment in the vicinity of proposed borings to assure the safety of drilling in these areas and to assess other potential subsurface anomalies that may exist, which may be indicative of buried storage tanks or other potential items of concern.

2.2 SOIL INVESTIGATION

Subsurface Soils

Drilling services were provided by NYEG. The soil investigation included the advancement of nine (9) soil borings (SB-01 through SB-09) at the Site. The borings were advanced using direct-push methods. Soil samples were collected continuously in each boring using macro-core sampling tools, until a depth of 15-feet below ground surface (BGS), or until refusal. Field examination and headspace analysis was performed using a photoionization detector (PID) on soils collected from each respective three-foot or five-foot macro-core sample. The purpose of the headspace analysis was to screen for volatile vapors. Soil samples were collected from each of the nine (9) borings and placed in laboratory-supplied containers.

One (1) sample from each of six (6) borings, based upon observations and/or PID screening results, was submitted for laboratory analysis. Samples were analyzed for STARS-list volatile organic compounds (VOCs) using USEPA method 8260 (one of the samples was submitted for full-list VOCs analysis, based upon field observations), and STARS-list semi-volatile organic compounds (SVOCs) using USEPA method 8270.

Surface Soils

The northern lot was divided into four (4) approximately equal plots, where composited surface soil samples were collected (each composite sample was comprised of 4 discrete grab locations within the plot).

The four (4) composited surface soil samples were submitted to the laboratory for analysis of STARS-list SVOCs via USEPA method 8270, PCBs by USEPA method 8082, and RCRA 8 metals via USEPA method 6010/7471.

Soil Piles

AECC identified two (2) soil piles to be sampled during site investigative activities. However, significant snow cover limited complete visual review of the Site, and additional soil pile(s) may be present that could require sampling at a later date, if present.

The soil pile samples were placed in coolers and shipped via FedEx to Eurofins/Spectrum Analytical, Inc. in Agawam, Massachusetts for analysis of STARS-list SVOCs by USEPA method 8270, PCBs by USEPA method 8082, and RCRA 8 metals by USEPA method 6010.

2.3 GROUNDWATER INVESTIGATION

Groundwater investigation involved the installation of four (4) temporary one-inch (1") diameter monitoring wells (at soil boring locations SB-01, SB-03, SB-05, and SB-07) the collection of a groundwater sample from each well. Temporary well locations were based upon PID readings, field observations, and the information reviewed in the previous investigation (Plumley report).

On January 8, 2018, the temporary wells were purged utilizing low-flow methods with a peristaltic pump, in an attempt to stabilize groundwater parameters. During the purging of the wells, turbidity, pH, dissolved oxygen, temperature, and electrical conductivity were measured in the field at regular intervals to confirm groundwater stabilization prior to sampling. After the parameters stabilized, a sample was collected from each monitoring well and stored in laboratory-supplied containers. Groundwater samples were handled under the same protocol as the soil samples.

Groundwater samples were analyzed for full-list VOCs using USEPA method 8260 and STARS-list SVOCs via USEPA method 8270.

Each well was allowed to rest for approximately 96-hours prior to sampling. AECC personnel gauged the wells for depth to water (DTW) and to determine if any free product accumulated in the wells during the rest period.

On January 8, 2017, AECC personnel used a low-flow peristaltic pump to purge approximately three (3) calculated well volumes from each well. After purging each well volume, a multi-function water quality meter was used to record field parameters, including: temperature, pH, specific conductance, dissolved oxygen, redox potential, and turbidity. Once field parameters stabilized, the groundwater was transferred directly from the end of the pump tubing into laboratory-supplied vials and plastic bottles (with appropriate preservative chemicals, as necessary). Once collected, the groundwater samples were labeled, logged, placed on ice, and shipped via FedEx under strict chain-of-custody procedures to Eurofins/Spectrum Analytical, Inc. in Agawam, Massachusetts.

2.4 SUPPLEMENTAL GROUNDWATER INVESTIGATION

Based upon the findings of AECC's initial investigation activities, supplemental investigation activities were performed at the Site on February 7 and 8, 2018. The purpose of the supplemental investigation was to further define the nature and extent of groundwater contamination at the Site.

The supplemental soil investigation included the advancement of five soil borings (SB-10 through SB-14) and installation of three temporary one-inch (1") diameter monitoring wells (at soil boring locations SB-12, SB-13, and SB-14). AECC followed the protocols established for the initial investigation activities, except each well was allowed to rest for approximately 24-hours prior to sampling in order to meet time constraints.

Groundwater samples from each of the three wells were analyzed for STARS-list VOCs using USEPA method 8260. One groundwater sample was analyzed for lead via USEPA method 6010.

Soil samples were not analyzed since the initial investigation revealed that soils were not significantly contaminated (i.e. – contamination appeared to be dissolved in groundwater).

PHASE II ENVIRONMENTAL SITE ASSESSMENT
Syracuse Scale, 156-158 Solar Street, Syracuse, New York

3.0 FIELD OBSERVATIONS

Field activities associated with AECC's investigation were conducted at the Site in early January 2018 and have been summarized below:

3.1 SOIL INVESTIGATION

The subsurface conditions were generally typified by the presence of a thick layer of peat with an earthy odor found between 3-feet to 12-feet bgs. Some medium and coarse sands were also interspersed, and coarser material was generally found around the level of the groundwater table (approximately 11 feet bgs).

Petroleum odors were detected in several borings during the soil screening process. In addition, PID response (indicative of soil contamination) was recorded during headspace analysis, as summarized below:

Boring ID	Peak PID Reading (ppm)	Depth of Associated Reading
SB-01	0.6	12 – 15'
SB-02	665	9 – 12'
SB-03	2.7 443	3 – 6' 9 – 12'
SB-04	0.5	10 – 15'
SB-05	0.1	10 – 15'
SB-06	0.0	N/A
SB-07	13.2	0 – 3'
SB-08	1.4	0 – 3'
SB-09	0.3	0 – 3'
SB-10	3.7	12 – 15'
SB-11	2.5 10.8	0.5 – 5' 13 – 15'
SB-12	55.8	10 – 15'
SB-13	2,452 1,823	10.5 – 12' 12 – 15'
SB-14	1,950	10 – 15'

For a complete description of the soil profile and a summary of PID headspace readings at each boring location, please refer to the soil boring logs presented in Attachment A.

Prior to leaving the Site, the borings were backfilled with boring cuttings and/or sand. Temporary wells will remain in place at the Site until it is determined that they are no longer useful.

3.2 GROUNDWATER INVESTIGATION & SAMPLING

Eight temporary monitoring wells constructed of a 10-foot section of one-inch (1") diameter, 0.10-inch slotted screen, and approximately 6-feet of one-inch (1") diameter threaded riser (where necessary), were installed at soil boring locations SB-01, SB-03, SB-05, SB-07, SB-12, SB-13, and SB-14. Temporary Well TW-05 was installed during Plumley's previous investigation (B-5/TW). The locations of the temporary monitoring wells are shown on Figure 1. Note that groundwater is not used on the property as it is serviced with municipal water.

The groundwater quality parameters observed / measured at each well are presented in Table 7. In summary:

- Groundwater typically ranged from approximately 9 to 11 feet bgs. Shallower depth-to-groundwater (approximately 3 to 5 feet bgs) was encountered at TW-03 and TW-04; which may be due to a perched water table and/or leaking municipal water lines near these locations.
- Groundwater within wells TW-03, TW-06, and TW-07 was very turbid (error reading on meter). In the remaining five wells, turbidity ranged from 10.9 to 67.8 NTU.
- The wells provided ample water, with a maximum drawdown during purging of 0.6 feet.
- A thick, sludgy material was observed at the bottom of well TW-03. Purging efforts were unable to clear the sludgy material from the well column. As a result, groundwater parameters were not measured at TW-03.
- The measured depth to groundwater in well TW-05 on January 8, 2018 was 11.18' bgs, while the total well depth was approximately 18.2' bgs (some sediment appeared to have settled at the bottom of the well).

3.3 DETERMINATION OF GROUNDWATER FLOW

On January 18, 2018, AECC personnel collected surface elevation and well riser elevations relative to a benchmark (a steel support beam inside the vacant middle portion of the Facility). Using this information, along with depth to groundwater measurements collected during well sampling activities on January 8, groundwater elevations were calculated for each well.

Discounting what appears to be anomalous depth to groundwater measurements on the western and eastern portion of the Site (TW-03 and TW-04), it appears that groundwater levels are relatively flat across the measurable portion of the Site. However, this groundwater flow determination was not definitively determined due to the limited number of wells and their incomplete distribution across the Site.

The generally flat contours determined across the center of area surveyed during this investigation is similar to the data obtained by Plumley during their 2016 Investigation. Subsequent survey to include data from other Plumley wells that remain at the Site or on the parcel south of the Site may provide further detail to definitively establish groundwater trends if such information was necessary for the redevelopment of the property.

The anomalous groundwater elevations encountered could be explained by a perched water table and/or by subsurface building foundation elements (since portions of the data obtained during this investigation came from directly beneath the building structure, which could impact groundwater depth).

3.4 SURFACE SOILS / SOIL PILES

Surface soils were generally comprised of a dark brown fine gravel, with some coarser gravel fragments interspersed, along with slag. Some organic material (vegetation roots) permeated up to 6" deep.

The soil piles appeared to be of a similar material to surface soils, but were generally more coarse and less organic material was present.

No odors, staining, or PID response were noted during surface soil sample screening / collection or during soil pile sample screening / collection activities.

3.5 ADDITIONAL OBSERVATIONS OF CONCERN – NOT IN SCOPE

The following environmental concerns were noted, but were not included in the Scope of this Phase II ESA:

- AECC was informed that the vaulted petroleum storage tank adjacent to the boiler room had been cut open and cleaned, and that adjacent areas had been cleaned, by a contracted environmental firm. While this area appeared significantly cleaner than during AECC's previous site reconnaissance (October 2017), residual staining remains present within the boiler room and an adjacent storage room. Petroleum odors still linger in these areas. AECC was not provided with a report or assessment of the cleanup from the firm that performed the cleanup work associated with these locations.
- AECC noted the presence of approximately 12 glass jars, some intact while other had fallen and spilled their contents, on the uppermost mezzanine area of the facility. Labels on the jars were mostly incomplete or illegible. Labels that could be discerned indicated that the chemicals are likely dyes, or other chemicals formerly used in textile production. Please refer to AECC's Phase I ESA report for further details.

4.0 LABORATORY ANALYTICAL RESULTS

Soil sample analysis results were compared to applicable Unrestricted Use, Restricted Residential Use (intended use of the Site), and Industrial (current use of the Site) Soil Cleanup Objectives (SCOs) referenced in NYSDEC Commissioner's Policy #51 (CP-51), and/or 6 NYCRR Part 375 (Part 375).

Groundwater analytical results were compared with the NYSDEC groundwater standards and guidance values published in the NYSDEC Division of Water Technical and Operations Guidance Series (TOGS) Memorandum 1.1.1.

Summary tables comparing the detected contaminant concentrations to the applicable NYSDEC standards / guidance values are presented in the Tables section of this report (Tables 1 through 6). The complete laboratory analysis report is presented as Attachment B.

4.1 SURFACE SOILS & SOIL PILES

Surface Soils

The northern lot was subdivided into four (4) regions, as described in Section 2.2, for composite sampling. The sample identifications correspond to the following table, and are also shown on Figure 1:

SURF-04 (Northwest)	SURF-02 (Northeast)
SURF-03 (Southwest)	SURF-01 (Southeast)

SVOCs were detected at concentrations that exceed their respective Unrestricted Use SCOs from samples SURF-01 and SURF-03 (southern half of the lot). In addition to exceeding the Unrestricted Use SCO, several SVOCs exceeded their respective Restricted Residential Use RSCO, and the chemical compound benzo(a)pyrene was detected at a concentration that exceeds its Industrial Use RSCO. No SVOCs were detected at concentrations that exceed their respective Unrestricted Use SCOs from samples SURF-02 and SURF-04 (northern half of the lot).

No PCBs were detected in the SURF-02 soil sample above below the unrestricted use SCO. No PCBs were detected in the SURF-01, SURF-03, or SURF-04 samples.

Multiple metals (mercury, barium, and lead) were detected at concentrations that exceed their respective Unrestricted Use SCOs from samples SURF-01 and SURF-03, while only mercury was detected at a concentration that exceeded its respective Unrestricted Use SCO in samples SURF-02 and SURF-04. No metals exceeded their respective Restricted Residential or Industrial RSCOs.

Soil Piles

AECC identified two (2) soil piles in the northern lot. Soil Pile 01 is a small berm that spans along the southern portion of the lot. Soil Pile 02 is located amongst the trees lining the eastern edge of the lot.

PHASE II ENVIRONMENTAL SITE ASSESSMENT
Syracuse Scale, 156-158 Solar Street, Syracuse, New York

The sampling results of Soil Pile 01, which stretches across portions of surface soil plot areas SURF-01 and SURF-03, were similar to the sampling results of SURF-01 and SURF-03. Metals did not exceed the Unrestricted Use SCO, but multiple SVOCs were detected at concentrations that exceed their Unrestricted Use SCO, and in some instances, the Restricted Residential RSCO. Like SURF-01 and SURF-03, benzo(a)pyrene was detected at a concentration that exceeds the Industrial Use RSCO from Soil Pile 01. A trace concentration of PCBs was detected from the Soil Pile 01 sample, but at a concentration that does not exceed the Unrestricted Use SCO.

The analytical results of the sample composited from Soil Pile 02 exhibited elevated concentrations of contaminants as compared to Soil Pile 01 and the surface soil samples. Chromium and lead were detected at concentrations that exceeded their respective Unrestricted Use SCOs. Multiple SVOCs were detected above their respective Unrestricted Use SCOs, several exceeded their Restricted Residential Use RSCO, and the compounds benzo(a)pyrene, benzo(b)fluoranthene, and dibenzo(a,h)anthracene exceeded their respective Industrial Use RSCO. The total concentration of SVOCs detected in Soil Pile 02 equals 131.81 ppm. For comparison, the total quantity of detected SVOCs from all surface soil samples and Soil Pile 01 ranged from 1.92 to 25.44 ppm. Trace amounts of PCBs were detected in the Soil Pile 02 sample, but at concentrations below the Unrestricted Use SCO.

4.2 SUBSURFACE SOILS

VOCs

No VOCs were detected above laboratory detection limits from soil samples SB-05 or SB-09. A trace quantity of benzene was detected in soil sample SB-01, but at a concentration below the Unrestricted Use SCO for benzene. The compound 1,2,4-trimethylbenzene was detected in soil sample SB-07, but at a concentration below its respective Unrestricted Use SCO.

The following VOCs were detected at concentrations that exceed their respective Unrestricted Use SCO (but not their Restricted Residential Use or Industrial RSCOs) from soil samples SB-02 and SB-03:

- Isopropylbenzene
- n-Propylbenzene
- 1,2,4-trimethylbenzene
- Xylene
- Ethylbenzene (*SB-03 only)

SVOCs

No SVOCs were detected above laboratory detection limits from soil sample SB-01. Multiple SVOCs were detected in soil samples SB-05 and SB-07, but at concentrations that do not exceed their respective Unrestricted Use SCOs.

Trace quantities of multiple SVOCs were detected in soil samples SB-02 and SB-03, but only the concentration of 2-methylnaphthalene exceeded its respective Unrestricted Use SCO (but not its respective Restricted Residential or Industrial Use RSCO).

Multiple SVOCs were detected at concentrations exceeding their respective Unrestricted Use SCOs in the SB-09 soil sample. Several of these SVOCs also exceeded their Restricted Residential Use RSCO, and benzo(a)pyrene exceeded its Industrial Use RSCO.

4.3 GROUNDWATER

VOCs

No VOCs were detected above laboratory detection limits from groundwater samples TW-01, TW-03, or TW-04.

The concentrations of VOCs detected in the shared Plumley/AECC well dropped significantly. In Fall 2016, the total concentration of VOCs was 773.4 ppb and 12 individual compounds exceeded their respective GWS. AECC's re-sampling of the well detected a total VOC concentration of 24 ppb and two (2) individual compounds exceeded their respective GWS.

Groundwater contamination was encountered at TW-02, where 10 individual compounds were detected above their respective GWS. The total concentration of VOCs detected in sample TW-02 was 463.25 ppb, with the primary contaminant being 1,2,4-trimethylbenzene.

AECC performed the supplemental investigation in response to the groundwater analysis results of the sample collected from TW-02. Significant groundwater contamination was encountered at all three temporary wells installed and sampled during supplemental activities (TW-06, TW-07, and TW-08). The total concentration of VOCs detected in these samples was 88.7 ppb, 693.1 ppb, 275.3 ppb, respectively; and a total of 5, 11, and 8 individual compounds were detected above their respective GWS from the samples, respectively.

No chlorinated compounds were detected in the groundwater collected from any of the wells installed during the original investigation. Therefore, AECC did not have the samples collected during the supplemental investigation analyzed for chlorinated compounds.

SVOCs

No SVOCs were detected above laboratory detection limits from any of the five (5) groundwater samples collected by AECC during this investigation, which included the re-sampling of one off-site Plumley well that had been installed and sampled in 2016 (Plumley well B-5/TW, AECC well TW-05). For comparison, during Plumley's sampling, naphthalene was detected at a concentration of 65.8 ppb (exceeding the GWS of 10 ppb), but naphthalene was not detected in the sample collected from the same well by AECC.

Metals

AECC analyzed the TW-08 groundwater sample for lead since the results from Plumley's investigation revealed elevated concentrations of lead in the groundwater sample collected from well B-5/TW, which suggested the source of the contamination could be leaded gasoline.

No lead was detected in the sample submitted for analysis from TW-08.

5.0 SUMMARY AND CONCLUSIONS

Surface Soils & Soil Piles

Surface soils on the northern lot are contaminated by various metals and SVOCs, and the contamination appears more prevalent on the southern half of the lot, nearer the main portion of the building / Facility. If these soils are disturbed during Site re-development activities, the soils should be screened and managed by an environmental professional, as the soil may require off-site disposal. Based upon the orientation of Soil Pile 01 (berm along the southern edge; potentially created by snow-plowing activities or used as a source for topping the lot) and the similarity of analytical results between it and the surface soil samples collected in the vicinity, Soil Pile 01 can be managed along with the surface soils in the area.

Soil Pile 02, located on the eastern portion of the lot, appears to be a separate material from the remainder of the surface soils based upon analytical results. Soil Pile 02 is more discrete and in a location that would likely not cause it to be created by other site activities. Soil Pile 02 should be removed from the Site in accordance with proper environmental management protocols.

Management of such soils is routine in urban settings, but does require proper handling, transportation, and disposal (if necessary).

Gasoline Contamination

Field observations (odors and PID readings) and laboratory analytical results indicate that dissolved-phase gasoline contamination exists in the southeastern corner of the Site, and extends off-site to the south. Although some individual VOC concentrations in soils exceeded Unrestricted SCOs, no concentrations exceeded their respective Restricted Residential SCOs. Therefore, it appears the gasoline contamination is dissolved within groundwater, and soils reflect nuisance conditions as noted by odors and PID readings.

Based on the results of the Plumley and AECC investigations, groundwater flow appears to flow towards the west or northwest at a very shallow gradient.

A point-source of the contamination has not been identified during the course of this investigation. However, based on the concentrations of contaminants and PID readings, likely candidates would be a gasoline UST located either 1) beneath the wooden loading dock adjacent to the southern wall of the factory building, or 2) to the north of the area investigated to-date (i.e. - north of SB-13/TW-07 and SB-02). Therefore, AECC recommends that wells be installed to the north of SB-13/TW-07 and SB-02. If this investigation verifies that the source of the gasoline contamination is not located to the north, AECC recommends that the wooden loading dock be removed, and additional GPR and/or exploratory digging (where feasible) be performed in the area in an attempt to locate an underground tank or other source of contamination. AECC advised the property Owner of the contamination and recommended that the condition be reported to the NYSDEC Spill Hotline.

Although previous sampling at the Site suggested lead may be a concern in relation to this plume of VOC contamination, the sampling performed during this supplemental investigation indicates that lead is not a concern (not detected in the groundwater sample collected at TW-08).

Boiler Room and adjacent Storage Room – Residual Oil Cleanup

Residual staining and odors and discrete areas of free product remain despite previous cleanup efforts in the boiler room and adjacent storage room area. AECC recommends further cleaning of these areas by an environmental remediation firm.

Suspected Fuel Oil Contamination – Shallow Subsurface Soil

Field observations and analytical data collected from shallow subsurface soils beneath the concrete building slab in and around the former boiler room and petroleum storage tank (within the Facility) suggest a second, separate, contamination source is present. This contamination appears to be from a heavier petroleum compound (fuel oil) and exists at shallower soil depths than the gasoline contamination previously discussed. These findings were anticipated given the fuel oil spill observed in the boiler room in October 2017, as previously discussed.

The contamination appears to be confined to an area bounded by SB-12 to the south, SB-02 and SB03 to the west. Although the soil and groundwater analysis results from SB-07/TW-03 (to the north) did not detect SVOCs, the soils exhibited nuisance characteristics (odors and staining, and a thick sludgy material). Further delineation of the extent of shallow fuel oil contamination to the east is complicated by existing boiler room equipment and the eastern property line.

Since no SVOCs were detected in groundwater collected from wells TW-02, TW-03, and TW-06, it appears the fuel oil contamination is limited to soils, and has not dissolved within groundwater.

Vapor Intrusion

Soils and groundwater exhibiting petroleum odors and elevated PID readings exist beneath the on-Site factory building and off-Site warehouse building. Therefore vapor intrusion is a concern. AECC recommends that a vapor intrusion investigation be performed and/or a sub-slab vapor mitigation system be installed during Site redevelopment activities.

3rd Floor / Mezzanine – Chemical Jar Cleanup

Representative samples of the unidentified/unknown chemicals (presumed dyes and related compounds) should be collected so that they can be properly characterized. Once properly characterized, the area should be cleaned and the chemicals properly disposed of in accordance with state and federal regulations prior to occupancy of the area.

Reporting

The Owner of the Site has been notified of the two apparent petroleum spills (fuel oil and gasoline) at the Site. It is our professional opinion that the Owner is required to report the spills to the NYSDEC (Spill Hotline Number: 1-800-457-7362); but the Owner can contact their legal counsel to discuss this requirement. Future cleanup / management options should comply with NYSDEC requirements and provide proper management and handling of contaminated media.

PHASE II ENVIRONMENTAL SITE ASSESSMENT
Syracuse Scale, 156-158 Solar Street, Syracuse, New York

If you have any questions regarding the information presented in this report, please feel free to contact AECC's office at your convenience.

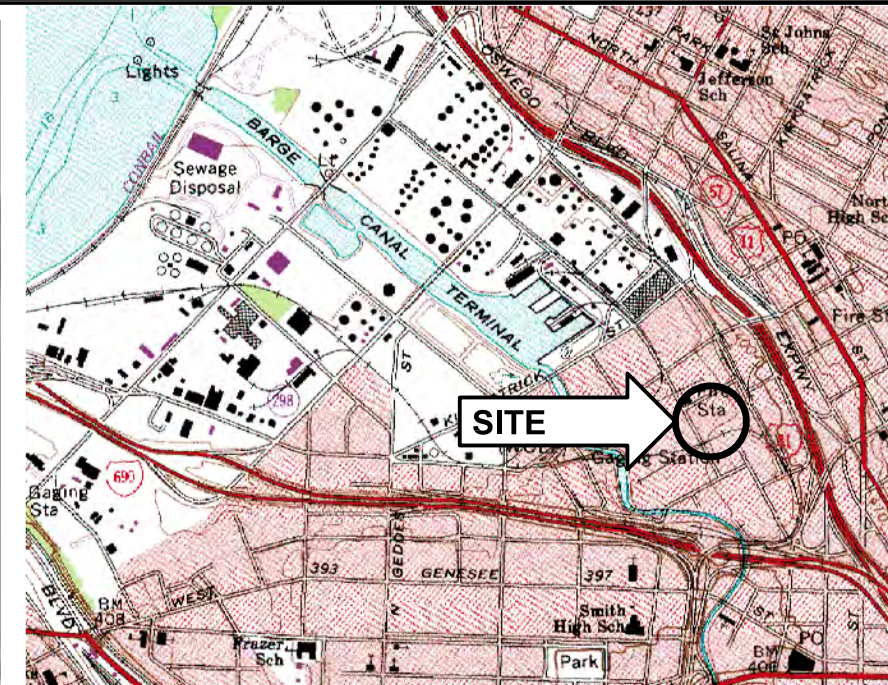

Sincerely,
Asbestos & Environmental Consulting Corporation

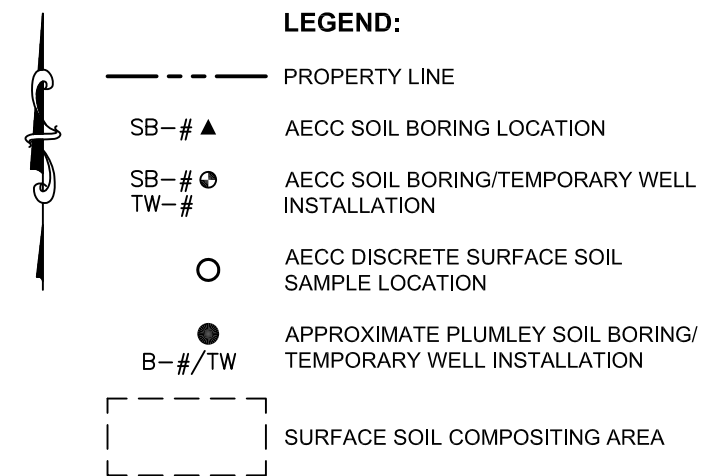

Richard D. McKenna
Project Manager

SOIL BORING LOGS

Soil Boring Log

Project #/Name:	17-258 / Syracuse Scale Facility	BORING ID: SB-01
Client:	BBL Construction Services, LLC	
Site Location:	156-158 Solar Street, Syracuse, NY	
Coordinates:		Sheet: 1 of 1
Drilling Contractor:	NYEG	Logged By: DB
Drilling Method:	Direct-Push Geoprobe (After Core-Drilling through concrete slab)	Boring Diameter: 2"
Date:	January 3, 2018	Ground Elevation:
Time Start:	1242	Boring Depth: ~15' bgs
Time Finish:	1359	Water Level: 9.34' bgs
Sample Type(s):	3' MacroCore Sleeves	
Monitoring Well?	Temporary/Permanent: Temp (TW-01) Diameter: 1" PVC Screened Interval: 4.69 to 14.69' bgs Riser Height: 6.52'	

Depth (ft)	Sample Depth (ft)	Blow Count (per 6 inches)	Recovery (ft)	PID Response (ppmv)	MATERIALS: Color, size, range, MAIN COMPONENT, minor component(s), moisture content, structure, angularity, maximum grain size, odor, and geologic unit (if known)	Lab Sample ID (Depth)
1			2'	0.0	0 - 0.5' - 6" CONCRETE SLAB 0.5 - 1' - Dark gray, medium SAND, some fine gravel pieces 1 - 3' - Brown, fine SAND	
2				(0.0)		
3						
4			3'	(0.0)	3 - 6' - Dark gray/black, PEAT material (fine sand / silt, squishy), earthy odor, moist	
5						
6						
7			2.75'	(0.0)	6 - 9' - Dark brown/black, PEAT material (fine sand / silt, squishy), earthy odor, moist	
8						
9	▼					
10			2.5'	(0.4)	9 - 11' - Dark brown/gray/black, PEAT material (fine sand / silt, squishy), earthy odor, moist	Sample SB-01 for VOCs and SVOCs
11					11 - 12' - Dark gray, fine SAND and fine gravel pieces, moist, petroleum odor	
12						
13			3*	(0.6)	12 - 15' - Dark gray, medium SAND and very coarse sand, some fine gravel, wet, petroleum odor	
14						
15					Boring terminated at ~15' bgs	
16						
17						
18						
19						
20						

bgs = below ground surface
 ▼ = observed water level

NOTES: * - Top 6 to 12" of recovered material from the 12' to 15' bgs sample appears to be 'slough' from shallower depths

EUROFINS/SPECTRUM ANALYTICAL LABORATORY ANALYSIS REPORTS

Laboratory Report
SC42941

AECC Environmental Consulting
 6308 Fly Road
 East Syracuse, NY 13057
 Attn: Rich McKenna

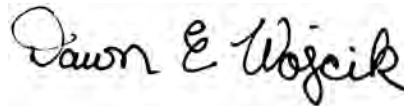

Project: Syracuse Scale - Solar St - NY
 Project #: 17-258

I attest that the information contained within the report has been reviewed for accuracy and checked against the quality control requirements for each method. These results relate only to the sample(s) as received.
 All applicable NELAC requirements have been met.

- Massachusetts # M-MA138/MA1110
- Connecticut # PH-0777
- Florida # E87936
- Maine # MA138
- New Hampshire # 2972/2538
- New Jersey # MA011
- New York # 11393
- Pennsylvania # 68-04426/68-02924
- Rhode Island # LAO00348
- USDA # P330-15-00375
- Vermont # VT-11393

Authorized by:
 Dawn Wojcik
 Laboratory Director

Eurofins Spectrum Analytical holds primary NELAC certification in the State of New York for the analytes as indicated with an X in the "Cert." column within this report. Please note that the State of New York does not offer certification for all analytes. Please refer to our website for specific certification holdings in each state.

Please note that this report contains 56 pages of analytical data plus Chain of Custody document(s). When the Laboratory Report is indicated as revised, this report supersedes any previously dated reports for the laboratory ID(s) referenced above. Where this report identifies subcontracted analyses, copies of the subcontractor's test report are available upon request. This report may not be reproduced, except in full, without written approval from Eurofins Spectrum Analytical, Inc.

Eurofins Spectrum Analytical, Inc. is a NELAC accredited laboratory organization and meets NELAC testing standards. Use of the NELAC logo however does not insure that Eurofins Spectrum Analytical, Inc. is currently accredited for the specific method or analyte indicated. Please refer to our Quality web page at www.spectrum-analytical.com for a full listing of our current certifications and fields of accreditation. States in which Eurofins Spectrum Analytical, Inc. holds NELAC certification are New York, New Hampshire, New Jersey, Pennsylvania and Florida. All analytical work for Volatile Organic and Air analysis are transferred to and conducted at our 830 Silver Street location (PA-68-04426).

Please contact the Laboratory or Technical Director at 800-789-9115 with any questions regarding the data contained in this laboratory report.

SC42941-12	SURF-04	Soil	04-Jan-18 10:02	06-Jan-18 11:01

CASE NARRATIVE:

Data has been reported to the RDL. This report includes estimated concentrations detected below the RDL and above the MDL (J-Flag).

All non-detects and all results below the detection limit are reported as “<” (less than) the detection limit in this report.

The samples were received 1.8 degrees Celsius, please refer to the Chain of Custody for details specific to temperature upon receipt. An infrared thermometer with a tolerance of +/- 1.0 degrees Celsius was used immediately upon receipt of the samples.

If a Matrix Spike (MS), Matrix Spike Duplicate (MSD) or Duplicate (DUP) was not requested on the Chain of Custody, method criteria may have been fulfilled with a source sample not of this Sample Delivery Group. If method or program required MS/MSD/Dup were not performed, sufficient sample was not provided to the laboratory.

All VOC soils samples submitted and analyzed in methanol will have a minimum dilution factor of 50. This is the minimum amount of solvent allowed on the instrumentation without causing interference. Soils are run on a manual load instrument. 100ug of sample (MEOH) is spiked into 5ml DI water along with the surrogate and added directly onto the instrument. Additional dilution factors may be required to keep analyte concentration within instrument calibration range.

Method SW846 5035A is designed to use on samples containing low levels of VOCs, ranging from 0.5 to 200 ug/Kg. Target analytes that are less responsive to purge and trap may be present at concentrations over 200ug/Kg but may not be reportable in the methanol preserved vial (SW846 5030). This is the result of the inherent dilution factor required for the methanol preservation.

All volatile soil/product/solid samples should be collected in accordance method SW846 5035/5035A. Any sample with a result below 200ug/Kg that has not been collected in accordance with method 5035/5035 A must be evaluated as potentially biased low.

See below for any non-conformances and issues relating to quality control samples and/or sample analysis/matrix.

SW846 6010C

Laboratory Control Samples:

1800269 SRM/SRMD

Cadmium percent recoveries (91/82) are outside individual acceptance criteria (82.4-117.6), but within overall method allowances. All reported results of the following samples are considered to have a potentially low bias:

- Soil Pile 01
- Soil Pile 02
- SURF-01
- SURF-02
- SURF-03
- SURF-04

SW846 8260C

Calibration:

1712025

SW846 8260C

Calibration:

1712025

Analyte quantified by quadratic equation type calibration.

1,2,3-Trichlorobenzene
1,2,4-Trichlorobenzene
1,2,4-Trimethylbenzene
1,2-Dibromo-3-chloropropane
1,3,5-Trichlorobenzene
1,3,5-Trimethylbenzene
1,4-Dioxane
2-Hexanone (MBK)
4-Chlorotoluene
4-Isopropyltoluene
4-Methyl-2-pentanone (MIBK)
Bromoform
cis-1,3-Dichloropropene
Dibromochloromethane
Di-isopropyl ether
Ethyl tert-butyl ether
Ethylbenzene
Isopropylbenzene
m,p-Xylene
Methyl tert-butyl ether
Naphthalene
n-Butylbenzene
n-Propylbenzene
o-Xylene
sec-Butylbenzene
Styrene
tert-Butylbenzene
Tetrahydrofuran
trans-1,3-Dichloropropene
trans-1,4-Dichloro-2-butene
Vinyl chloride

This affected the following samples:

S710689-ICV1

1801061

Analyte quantified by quadratic equation type calibration.

4-Isopropyltoluene
Naphthalene
sec-Butylbenzene

This affected the following samples:

S815994-ICV1

S815994-ICV1

Analyte percent recovery is outside individual acceptance criteria (80-120).

Carbon disulfide (78%)

This affected the following samples:

S815999-CCV1

Laboratory Control Samples:

This laboratory report is not valid without an authorized signature on the cover page.

SW846 8260C

Laboratory Control Samples:

1800329 BS/BSD

Vinyl chloride percent recoveries (62/60) are outside individual acceptance criteria (70-130), but within overall method allowances. All reported results of the following samples are considered to have a potentially low bias:

SB-03

Spikes:

1800329-MS1 *Source: SC42941-04*

The spike recovery was outside acceptance limits for the MS and/or MSD. The batch was accepted based on acceptable LCS recovery.

1,2,4-Trimethylbenzene

Samples:

S815841-CCV1

Analyte percent difference is outside individual acceptance criteria (20), but within overall method allowances.

2-Chlorotoluene (21.3%)
Chloroethane (-26.0%)
Chloromethane (-28.1%)

Analyte percent drift is outside individual acceptance criteria (20), but within overall method allowances.

Vinyl chloride (-38.2%)

This affected the following samples:

1800329-BLK1
1800329-BS1
1800329-BSD1
1800329-MS1
1800329-MSD1
SB-03

SC42941-04 *SB-02*

Sample dilution required for high concentration of target analytes to be within the instrument calibration range.

SC42941-05 *SB-03*

Sample dilution required for high concentration of target analytes to be within the instrument calibration range.

SC42941-06 *SB-05*

Reporting limits reflect SW846 5035A High Level extraction technique due to interference and/or QC issues using SW846 5035A Low Level extraction technique.

SC42941-08 *SB-09*

Surrogate recovery outside of control limits. The data was accepted based on valid recovery of the remaining surrogates with three required by program methods.

1,2-Dichloroethane-d4

SW846 8270D

Samples:

S815979-CCV1

SW846 8270D

Samples:

S815979-CCV1

Analyte percent difference is outside individual acceptance criteria (20), but within overall method allowances.

2-Methylnaphthalene (27.7%)

This affected the following samples:

1800428-BLK1
1800428-BS1
1800428-BSD1

S815980-CCV1

Analyte percent difference is outside individual acceptance criteria (20), but within overall method allowances.

2-Methylnaphthalene (27.7%)

This affected the following samples:

SB-01
SB-02
SB-03
SB-05
SB-07
SB-09
Soil Pile 02
SURF-01
SURF-02
SURF-03
SURF-04

S816005-CCV1

Analyte percent difference is outside individual acceptance criteria (20), but within overall method allowances.

2-Methylnaphthalene (22.6%)

This affected the following samples:

Soil Pile 01

SC42941-01 *Soil Pile 01*

The Reporting Limit has been raised to account for matrix interference.

Sample Acceptance Check Form

Client: AECC Environmental Consulting
Project: Syracuse Scale - Solar St - NY / 17-258
Work Order: SC42941
Sample(s) received on: 1/6/2018

The following outlines the condition of samples for the attached Chain of Custody upon receipt.

	<u>Yes</u>	<u>No</u>	<u>N/A</u>
Were custody seals present?	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
Were custody seals intact?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
Were samples received at a temperature of $\leq 6^{\circ}\text{C}$?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Were samples cooled on ice upon transfer to laboratory representative?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Were sample containers received intact?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Were samples properly labeled (labels affixed to sample containers and include sample ID, site location, and/or project number and the collection date)?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Were samples accompanied by a Chain of Custody document?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Does Chain of Custody document include proper, full, and complete documentation, which shall include sample ID, site location, and/or project number, date and time of collection, collector's name, preservation type, sample matrix and any special remarks concerning the sample?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Did sample container labels agree with Chain of Custody document?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Were samples received within method-specific holding times?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
